Motion Planner	22
Conversions	23

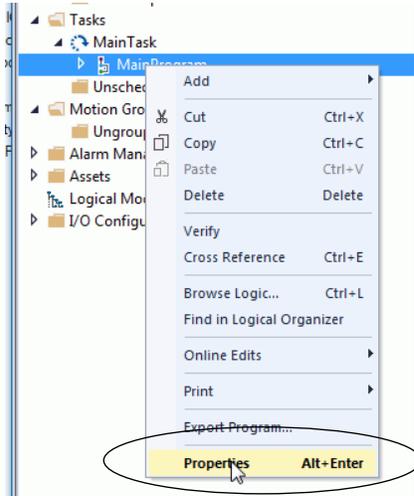

This publication provides **estimated** execution times when Logix 5000™ controllers execute instructions in Studio 5000 Logix Designer® projects.

IMPORTANT The execution times in this publication are approximations. Actual execution times vary based on project configuration and programming techniques. You can monitor actual execution times in your Logix Designer application project on a Program level. For more information on how to monitor your project to see actual execution times, see [Monitor Execution Times in a Project on page 2](#).
This publication is not a design document.

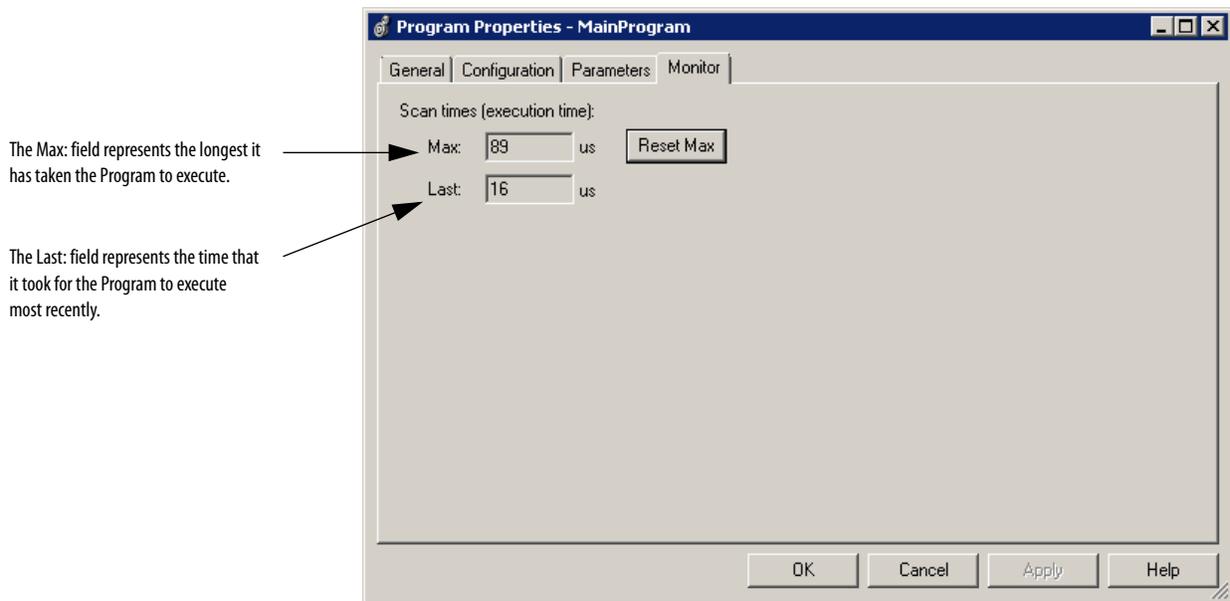

Monitor Execution Times in a Project

The Program Properties dialog box displays the raw execution times of a program. The times represent the total time that it took for all instructions that are included in the program logic to execute. The maximum and last scan times are provided. To monitor execution times, complete these steps.

1. Right-click the program and choose Properties.

2. On the Program Properties dialog box, click the Monitor tab to see execution times.

Before You Begin

Consider the following before you begin to use this book.

- The estimated times that are listed in this publication are in **microseconds (μ s)**.
- This publication excludes estimated times for instruction execution in sequential function chart (SFC) programming.
- Not all controllers support all versions of the Logix Designer application.

For example, some ControlLogix® 5580 controllers support the Logix Designer application, version 28.00.00 or later, and some ControlLogix 5580 controllers support version 29.00.00 or later.

For more information on controller and software compatibility, see the Rockwell Automation® Product Compatibility and Download Center (PCDC) that is available at <https://compatibility.rockwellautomation.com/Pages/home.aspx>.

- Not all controllers support all instructions.

For example, 5069-L306ERM controller supports Motion instructions, but the 5069-L306ER controller does not.

- The estimated execution times are the same regardless of the Logix Designer application project version within which they are used.

For example, the 1756-L85E controller executes the ADD instruction in ladder logic at the same speed in a Logix Designer application project, version 30.00.00 as in version 31.00.00.

- The estimated instruction execution times are the same regardless of the controller families within which the controllers are included.

For example, the 5069-L320ERM controller (CompactLogix™ 5380 family) executes an MAJ instruction at the same speed as the 5069-L350ERMS2 controller (Compact GuardLogix® 5380 family).

Design Considerations

We recommend that you consider the following when you design your application.

Array Subscripts	<ul style="list-style-type: none"> • When an array uses a tag for one of its subscripts, additional execution time is required, depending on the number of dimensions in the array. Remember that execution time for an instruction increases for each parameter that references an array. • If you use multiple dimensional arrays in an instruction, account for the additional time for each array reference. • The controller operates on 32-bit data structures. If you use a tag other than a DINT to reference a position in an array, remember to account for the additional time for the data conversion and for using a tag as an index. • If you use an expression in the index, additional time is used for the operators. The additional time depends on the type of operator.
Data Conversions	<ul style="list-style-type: none"> • If you use a data type that is not an optimal data type or if you mix data types, you must account for the additional execution time for data conversion. • If you mix integers and REALs in an instruction, the controller converts the values to REALs and then back to the destination data type.
Expressions	If an instruction contains an expression (CMP, CPT, FAL, FSC), add time for each operator in the expression. For each operator, use the values for the corresponding instruction from the "Ladder Instructions" tab. Keep in mind that data type conversions occur if different or non 32-bit data types are used.
Function Block	When you use Function Block instructions, remember to include the time for IREF, OREF, and/or the WIRE when you estimate execution time.
Structured Text	When you use Structured Text, remember that the number and complexity of the assignments, instructions, and comments that are included in the construct increases the required execution time.

Ladder Instructions

Logix 5000 controllers execute these ladder instructions. Remember, not all controllers support all instructions.

Ladder Instructions - ControlLogix 5580, GuardLogix 5580, CompactLogix 5380, and Compact GuardLogix 5380 Controllers

Instruction	Data Type	Notes	Time (µs)
ABS	DINT		0.011
ABS	REAL		0.016
ACS	REAL		1.365
ADD	DINT		0.013
ADD	REAL		0.084
AFI	—		0.001
ALMA	analog_alarm	.In is true, Alarm state doesn't change (input value doesn't change alarm level)	1.299

Structured Text

Logix 5000 controllers execute these structured text elements.

Structured Text Elements - ControlLogix 5580, GuardLogix 5580, CompactLogix 5380, and Compact GuardLogix 5380 Controllers

Structured Text Element	Example	Type	Data Type	Time (µs)
assignment, simple	A := B;		DINT_A := DINT_B	0.012
			DINT_A := INT_B	0.034
			DINT_A := REAL_B	0.175
			DINT_A := SINT_B	0.031
			INT_A := DINT_B	0.113
			INT_A := INT_B	0.135
			INT_A := REAL_B	0.202
			REAL_A := DINT_B	0.126
			REAL_A := INT_B	0.055
			REAL_A := REAL_B	0.019
			REAL_A := SINT_B	0.052
			SINT_A := DINT_B	0.112
			SINT_A := REAL_B	0.199
SINT_A := SINT_B	0.131			
assignment, complex	A := -B; A := B + C; A := sin(B);			Use the execution time for the ladder logic Compute (CPT) instruction plus time for each operator and function in the expression. For each operator and function, use the value for the corresponding instruction. For example, for Tag_A := Tag_B + Tag_C, use the time for the CPT instruction plus the time for the ADD instruction.
comparison, simple	A > B A = B	=	DINT	0.002
		=	REAL	0.002
		<>	DINT	0.002
		<>	REAL	0.002
		>	DINT	0.002
		>	REAL	0.006
		>=	DINT	0.002
		>=	REAL	0.006
		<	DINT	0.002
		<	REAL	0.006
		<=	DINT	0.002
		<=	REAL	0.006
comparison, complex	A > -B A > (B + C) A > sin(B)			Use the execution time for the ladder logic Compare (CMP) instruction plus time for each operator and function in the expression For each operator and function, use the value for the corresponding instruction. For example, for Tag_A > (Tag_B + Tag_C), use the time for the CMP instruction plus the time for the GRT instruction and the ADD instruction.

Structured Text Elements - ControlLogix 5580, GuardLogix 5580, CompactLogix 5380, and Compact GuardLogix 5380 Controllers
