The ControlLogix® Architecture provides a wide range of input and output modules to span many applications, from high-speed digital to process control. The ControlLogix architecture uses Producer/Consumer technology, which allows input information and output status to be shared among multiple ControlLogix controllers.
Summary of Changes

This publication contains new and updated information as indicated in the following table.

Available 1756 I/O Modules

Each 1756 ControlLogix standard and safety I/O module mounts in a ControlLogix chassis.

You can select these types of digital I/O modules.

</tr>
<tr>
<td>Electronic fusing</td>
<td>These modules have internal electronic fusing to help prevent too much current from flowing through the module. These modules have an E at the end of the catalog number.</td>
</tr>
<tr>
<td>Individually isolated</td>
<td>These modules have individually isolated inputs or outputs. These modules have an I at the end of the catalog number.</td>

Standard I/O Module Wiring

1756 ControlLogix standard I/O modules require either a Removable Terminal Block (RTB) or a 1492 interface module (IFM) to connect all field-side wiring. RTBs and IFMs are not included with the I/O modules. They must be ordered separately. See 1756 Removable Terminal Blocks on page 271 and Wiring Systems on page 272.

Safety I/O Module Wiring

1756-IB16S (1756 ControlLogix 16-point Sinking Safety Input Module) has been agency certified using only the ControlLogix RTBs (1756-TBCHS or 1756-TBS6HS). RTBs are not included with the I/O modules. They must be ordered separately. See 1756 Removable Terminal Blocks on page 271.

1756-OBV8S (ControlLogix 8-point Safety Bipolar/Sourcing Output Module) has been agency certified using only the ControlLogix RTBs (1756-TBNHS and 1756-TBSHS). RTBs are not included with the I/O modules. They must be ordered separately. See 1756 Removable Terminal Blocks on page 271.

Any application that requires agency certification of the ControlLogix system by using other wiring termination methods may require application-specific approval by the certifying agency. RTBs are not included with the I/O modules. They must be ordered separately.

- All terminals marked RTN are connected internally.
- A 249 Ω current loop resistor is located between IN-x and i RTN-x terminals.
- If multiple (+) or multiple (-) terminals are tied together, connect that tie point to an RTN terminal to maintain the module accuracy.
- Place additional loop devices (such as strip chart recorders) at the A location in the current loop.

IMPORTANT: When operating in 2-channel, High-Speed mode, only use channels 0 and 2.

- Use this table when wiring your module in Differential mode.

- All terminals marked RTN are connected internally.
- If multiple (+) or multiple (-) terminals are tied together, connect that tie point to an RTN terminal to maintain the module accuracy.
- Terminals marked RTN or i RTN are not used for differential voltage wiring.

IMPORTANT: When operating in 2-channel, High-Speed mode, only use channels 0 and 2.
- All terminals marked RTN are connected internally.
- For current applications, all terminals marked iRTN must be wired to terminals marked RTN.
- A 249 Ω current loop resistor is located between IN-x and iRTN-x terminals.
- Place additional loop devices (such as strip chart recorders) at the A location in the current loop.

- All terminals marked RTN are connected internally.
- Terminals marked iRTN are not used for single-ended voltage wiring.

1756-IF8I, 1756-IF8IK

ControlLogix isolated voltage/current analog input module.

**1756-IF8I, 1756-IF8IK Module Wiring Diagram - Current Mode with External Loop Power**

**IMPORTANT:** Remember the following:
- In this wiring diagram, an external, user-provided power supply provides 24V DC loop power.
- If separate power sources are used, do not exceed the specific isolation voltage as listed in the specifications.
- Place additional loop devices, for example, strip chart recorders, at either ‘A’ location in the current loop.

**1756-IF8I, 1756-IF8IK Module Wiring Diagram - Current Mode with Internal Loop Power**

**IMPORTANT:** Remember the following:
- In this wiring diagram, the module provides 24V DC loop power.
- If separate power sources are used, do not exceed the specific isolation voltage as listed in the specifications.
- Place additional loop devices, for example, strip chart recorders, at either ‘A’ location in the current loop.
**1756-IF8I, 1756-IF8IK Module Wiring Diagram - Voltage Mode**

**Inputs**
- Eight isolated channels - Any combination of Voltage or Current mode

**Voltage and current ratings**
- Backplane: 5.1V DC 200 mA, 24V DC 400 mA
- Input Voltage: -10V to +10V, 0V to 10V, 0V to 5V
- Input Current: 0 mA to 20 mA
- Output Current: 0 mA to 20 mA

**Input ranges**
- -10…10V
- 0…10V
- 0…5V
- 0…20 mA

**Resolution**
- 24-bit
- ±10.5V (1.49 µV/count)
- 0…10.5V (1.49 µV/count)
- 0…5.25V (1.49 µV/count)
- 0…21 mA (2.99 nA/count)

**Current draw @ 5.1V**
- 200 mA

**Current draw @ 24V**
- Voltage/Non-sourcing Current mode: 150 mA
- Sourcing Current mode: 400 mA (In Sourcing Current mode, the channel provides loop power.)

**Total backplane power**
- Voltage/Non-sourcing Current mode: 4.6 W
- Sourcing Current mode: 10.6 W

**Power dissipation**
- Voltage mode: 4.6 W (15.7 BTU/hr)
- Non-sourcing Current mode: 5.1 W (17.4 BTU/hr)
- Sourcing Current mode: 7.3 W (24.9 BTU/hr)

- All terminals marked RTN are connected internally.
- A 249 Ω current loop resistor is located between IN-x and i RTN-x terminals.
- If multiple (+) or multiple (-) terminals are tied together, connect that tie point to an RTN terminal to maintain the accuracy of the module.
- Place additional loop devices (such as strip chart recorders) at the A location in the current loop.

IMPORTANT: When operating in 4-channel, High-Speed mode, only use channels 0, 2, 4, and 6.
- All terminals marked RTN are connected internally.
- For current applications, all terminals marked i RTN must be wired to terminals marked RTN.
- A 249 Ω current loop resistor is located between IN-x and iRTN-x terminals.
- Place additional loop devices (such as strip chart recorders) at the A location in the current loop.

- All terminals marked RTN are connected internally.
- Terminals marked i RTN are not used for single-ended voltage wiring.

**1756-IRT8I, 1756-IRT8IK**

ControlLogix isolated RTD/Thermocouple analog input module.

**1756-IRT8I, 1756-IRT8IK Module Wiring Diagram - 3-wire RTD Input**

**IMPORTANT:** Remember the following:

- If separate power sources are used, do not exceed the specific isolation voltage as listed in the specifications.
- Terminals 1, 2, 35, and 36 are not used in RTD applications.
- For 2-wire resistor applications including calibration, make sure \text{IN}_x(-)/B and \text{IN}_x/RTD C are shorted together.

**1756-IRT8I, 1756-IRT8IK Module Wiring Diagram - 4-wire RTD Input**

**IMPORTANT:** Remember the following:

- If separate power sources are used, do not exceed the specific isolation voltage as listed in the specifications.
- Terminals 1, 2, 35, and 36 are not used in RTD applications.
1756-IRT8I, 1756-IRT8IK Module Wiring Diagram - Thermocouple Input

**IMPORTANT:** Remember the following:
- Connect the white end of the CJC sensor to the even-numbered terminal. Connect the orange end of the CJC sensor to the odd-numbered terminals.
  - For CIC 0:
    - White end - Connected to terminal number 2
    - Orange end - Connected to terminal number 1
  - For CJC 1:
    - White end - Connected to terminal number 36
    - Orange end - Connected to terminal number 35
- CJC sensors do not come with the module. You must order the sensors, product catalog number 1756-CJC, separately.
- If separate power sources are used, do not exceed the specific isolation voltage as listed in the specifications.

1756-IT16, 1756-IT16K

ControlLogix thermocouple analog input module.

**IMPORTANT:** Remember the following:
- Connect the white end of the CJC sensor to the even-numbered terminal. Connect the orange end of the CJC sensor to the odd-numbered terminals.
  - For CJC 0:
    - Orange end - Connected to terminal number 35
    - Orange end - Connected to terminal number 35
    - Orange end - Connected to terminal number 35
- CJC sensors do not come with the module. You must order the sensors, product catalog number 1756-CJC, separately.
- If separate power sources are used, do not exceed the specific isolation voltage as listed in the specifications.

(1) UL certification for 120/240V 50/60 Hz nominal. Rockwell Automation specified to 74…265, 47…63 Hz.

(2) The commutating dv/dt of the output voltage (OUTPUT to L2) should not exceed 0.2V/µs for loads under 50 mA. The commutating dv/dt rating of the module for loads 50…500 mA (OUTPUT to L2) is 4V/µs maximum. If the commutating dv/dt rating of the TRIAC is exceeded, the TRIAC could latch on. If the commutating dv/dt rating is exceeded in the 10…50 mA range, a resistor can be added across the output and L2. The purpose of this resistor is to increase the total output current to 50 mA (I=V/R). At 50 mA and above, the module has a higher commutating dv/dt rating. When adding a resistor for the output to L2, be sure it is rated for the power that it dissipates (P=(V**2)/R). If the commutating dv/dt rating is exceeded in the 50…500 mA range, the LT AC waveform could be at fault. Be sure that the waveform is a good sinusoid, void of any anomalies such as distorted, or flattened sections.

(3) Use this conductor category information for planning conductor routing as described in the system-level installation manual. See the Industrial Automation Wiring and Grounding Guidelines, publication 1779-4.1.

1. UL certification for 120/240V 50/60 Hz nominal. Rockwell Automation specified to 74…265V, 47…63 Hz.
2. Use this conductor category information for planning conductor routing as described in the system-level installation manual. See the Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1.
3. The commutating dv/dt of the output voltage (OUTPUT to L2) should not exceed 0.2V/µs for loads under 50 mA. The commutating dv/dt rating of the module for loads 50…500 mA (OUTPUT to L2) is 4V/µs maximum. If the commutating dv/dt rating of the TRIAC is exceeded, the TRIAC could latch on. If the commutating dv/dt rating is exceeded in the 10…50 mA range, a resistor can be added AC across the output and L2. The purpose of this resistor is to increase the total output current to 50 mA (I=V/R). At 50 mA and above, the module has a higher commutating dv/dt rating. When adding a resistor for the output to L2, be sure it is rated for the power that it dissipates (P=(V**2)/R). If the commutating dv/dt rating is exceeded in the 50…500 mA range, the L1 AC waveform could be at fault. Be sure that the waveform is a good sinusoid, void of any anomalies such as distorted, or flattened sections.

1756-OF8, 1756-OF8K

ControlLogix voltage/current output analog module

- Place additional loop devices (such as strip chart recorders) at the A location noted in the drawing.
- All terminals marked RTN are connected internally.

### Technical Specifications - 1756-ON8 (continued)

The commutating dv/dt of the output voltage (OUTPUT to L2) should not exceed 0.2V/µs for loads under 50 mA. The commutating dv/dt rating of the module for loads 50…500 mA (OUTPUT to L2) is 4V/µs maximum. If the commutating dv/dt rating of the TRAC is exceeded, the TRAC could latch on. If the commutating dv/dt rating is exceeded in the 10…50 mA range, a resistor can be added AC across the output and L2. The purpose of this resistor is to increase the total output current to 50 mA (I=V/R). At 50 mA and above, the module has a higher commutating dv/dt rating. When adding a resistor for the output to L2, be sure it is rated for the power that it dissipates (P=(V**2)/R). If the commutating dv/dt rating is exceeded in the 50…500 mA range, the L1 AC waveform could be at fault. Be sure that the waveform is a good sinusoid, void of any anomalies such as distorted, or flattened sections.

1756-IB16S

ControlLogix DC (18...32V) sinking safety input module.

You must connect a 24V DC SELV/PELV power source to the DC+/- terminals to provide field-side power.

**IMPORTANT**
- The 24V (DC+ and DC-) power connections are used to supply field-side power to the module.
- All terminals with the same name are connected together on the module. For example, DC+ can be connected to either terminal marked DC +.
- Do not physically connect more than two wires to a single RTB terminal.
- All other I/O modules in the same chassis must use an SELV/PELV power supply.
- The 1756-IB16S module is compatible with a 1756 ControlLogix Chassis, Series C. Do not install the 1756-IB16S module in a 1756 ControlLogix Chassis, Series B.

**1756-IB16S Simplified Schematic**
When the module is wired as shown, it is suitable for applications that are rated up to, and including, **Category 2** and **PLd** as defined in ISO 13849-1.

To achieve that suitability rating, you may have to perform diagnostic testing of the safety function. One diagnostic test method is to configure the safety input channel for Safety Pulse Test to test the circuit for short circuits to 24V DC.

**Channel Connections**
The diagram shows devices that are connected to safety input channel 0 and test output channel 0. You can connect devices to all 16 channels.
When the module is wired as shown, it is suitable for applications that are rated up to, and including, **Category 3** and **PLd** as defined in ISO 13849-1.

**IMPORTANT**

Switches are suitable for applications that are rated up to, and including SIL 3 CL3, PLd, Cat 3.

**Channel Connections**

This diagram shows devices that are connected to safety input channels 0 and 1. You can connect devices to all 16 channels.
When the module is wired as shown, it is suitable for applications that are rated up to, and including, **Category 4** and **PLe** as defined in ISO 13849-1. To achieve that suitability rating, you may have to perform diagnostic testing of the safety function.

One diagnostic test method is to configure the safety input channel for Safety Pulse Test to test the circuit for short circuits to 24V DC. Safety input pairs must be associated with different Test Output sources.

**Channel Connections**

This diagram shows devices that are connected to safety input channels 0 and 1; and to test outputs 0 and 1. You can connect devices to all 16 channels. Because of the pre-configured relationships between test outputs and input channels, wiring a dual channel device to input channels 0 and 8 is not supported if pulse testing is required, the same holds true for 1/9, 2/10, 3/11, 4/12, 5/13, 6/14, 7/15.

**IMPORTANT**
- The 24V (DC+ and DC-) power connections are used to supply field-side power to the module.
- All terminals with the same name are connected together on the module. For example, DC+ can be connected to either terminal marked DC+.
- Do not physically connect more than two wires to one RTB terminal.
- All other I/O modules in the same chassis must use an SELV/PELV power supply.
- The 1756-OBV8S module is compatible with a 1756 ControlLogix Chassis, Series C. Do not install the 1756-OBV8S module in a 1756 ControlLogix Chassis, Series B.
- Due to the higher internal power dissipation of the 1756-OBV8S module, do not install the 1756-OBV8S module next to any controller or communication module.

**1756-OBV8S Simplified Schematic**

This schematic represents EVEN channels. ODD channels would reverse which micro controller controls P and M.
Bipolar Mode

When the module is wired as shown, it is suitable for applications that are rated up to, and including, Category 2 and PLd as defined in ISO 13849-1.

To achieve that suitability rating, you may have to perform diagnostic testing and monitoring of the safety function. One diagnostic test method is to configure the safety output channel for Safety Pulse Test to test the circuit for short circuits to 24V DC.

Channel Connections

This wiring example shows connections to Safety Output 0. You are not limited to using channel 0 in this mode. You can use all channels as determined by your application.

We strongly recommend that, if you have a direct connection between the safety output module and an input module and those modules are powered by separate power supplies, you connect module DC- and actuator DC- together. This practice helps to eliminate grounding float from disrupting diagnostics.
When the module is wired as shown, it is suitable for applications that are rated up to, and including, **Category 4** and **PLe** as defined in ISO 13849-1.

To achieve that suitability rating, you may have to perform diagnostic testing and monitoring of the safety function. One diagnostic test method is to configure the safety output channel for Safety Pulse Test to test the circuit for short circuits to 24V DC.

- The application is configured so that a No Load fault can only be detected if the wires from **both** the P-terminal and the M-terminal are disconnected.

For Cat.4 applications, if your application remains in safe state, that is, the output is off, for a prolonged duration, we recommend that you take one of these actions:

- Apply output monitoring at the actuator. The monitoring can be direct or indirect.
- Limit the safe state to no more than 24 hours.
- Conduct functional test if safe state dwell time increases.

### Connection Pairs

The terminals for each channel function as a Bipolar connection pair when you use a 1756-OBV8S module in Bipolar switching mode. For example, the Safety Output 0 P (Sourcing) terminal and Safety Output 0 M (Sinking) terminal are a Bipolar connection pair. That is, they are a P-M pair.

When the module is in Bipolar switching mode, you must connect the device to both terminals.

### Channel Connections

This wiring example shows connections to the P-M pair for Safety Output 0. You are not limited to using channel 0 in this mode. You can use all channel pairs as determined by your application.

We strongly recommend that, if you have a direct connection between the safety output module and an input module and those modules are powered by separate power supplies, you connect the DC- terminals together. This practice helps to eliminate grounding float from disrupting diagnostics.

To achieve that suitability rating, you may have to perform diagnostic testing and monitoring of the safety function. One diagnostic test method is to configure the safety output channel for Safety Pulse Test to test the circuit for short circuits to 24V DC.

- **We strongly recommend** that you connect separate shielded cables to the P terminal and the M terminal to reduce possibility of a short between these terminals. If a short is detected across the P-M pair, the module outputs are turned off, but the actuator that is connected to the output pair remains on.
- No Load and Overload conditions are only detectable at the P terminal.

For Cat.4 applications, if your application remains in safe state, that is, the output is off, for a prolonged duration, we recommend that you take one of these actions:

- Apply output monitoring at the actuator. The monitoring can be direct or indirect.
- Limit the safe state to no more than 24 hours.
- Conduct functional test if safe state dwell time increases.

**Actuator DC Power**

In this wiring configuration, you must connect the DC+ terminal to an SELV/PELV-listed power supply. The DC+ and DC- on the actuator must be connected to the same power supply as the DC+ and DC- on the module.

**Connection Pairs**

The terminals for each channel function as a Bipolar connection pair when you use a 1756-OBV8S module in Bipolar switching mode. For example, the Safety Output 0 P (Sourcing) terminal and Safety Output 0 M (Sinking) terminal are a Bipolar connection pair. That is, they are a P-M pair.

When the module is in Bipolar switching mode, you must connect the device to both terminals.

**Channel Connections**

This wiring example shows connections to the P-M pair for Safety Output 0. You are not limited to using channel 0 in this mode. You can use all channel pairs as determined by your application.

We **strongly recommend** that, if you have a direct connection between the safety output module and an input module and those modules are powered by separate power supplies, you connect the DC- terminals together. This practice helps to eliminate grounding float from disrupting diagnostics.
Sourcing Mode

When the module is wired as shown, it is suitable for applications that are rated up to, and including, **Category 2** and **PLd** as defined in ISO 13849-1.

To achieve that suitability rating, you may have to perform diagnostic testing and monitoring of the safety function. One diagnostic test method is to configure the safety output channel for Safety Pulse Test to test the circuit for short circuits to 24V DC.

Connection Pairs
When you use dual-channel sourcing wiring on the 1756-OBV8S module, you must connect the devices to dual-channel connection pairs. For example, the devices are connected to channels 4 and 5 because they are a connection pair. These channels are dual-channel connection pairs:
- Channels 0 and 1 (shown)
- Channels 2 and 3
- Channels 4 and 5
- Channels 6 and 7

1756-CFM

ControlLogix configurable flowmeter module

This wiring diagram can be used in applications with 50 mV (magnetic pickup), 1.3V (TTL), or 4V (preamp level) thresholds. You must use the Studio 5000 Logix Designer® application to choose the appropriate threshold level for your specific application.
The 1756-CFM module provides Totalizer mode for metering applications, or high-speed frequency measurements for speed or rate control applications, on two channels connected to flowmeters.

- Detectors 1 and 2 must be wired in parallel.
- Customer VCC can be used to power detectors. In this case, though, the maximum current on the wiring arm must be less than 4 A.
- This wiring example shows a 12-24V DC standard prover that is connected to the module. If you use a 5V DC standard prover, make sure that the positive wire is connected to the 5V terminal (such as Z0 5V DC).

**1756-CMS1B1, 1756-CMS1C1**

ControlLogix Compute modules are chassis-based modules that let you communicate directly with a ControlLogix 5570 or ControlLogix 5580 controller via the system backplane and over a network. The Compute modules offer an embedded Microsoft® Windows 10 or Linux operating system within which you can create custom applications while utilizing an application programming interface (API).

ControlLogix 10...30V low-speed counter module

Simplified Schematic

Source Input Wiring

Nonisolated Wiring

Isolated Wiring

Sink Input Wiring

Additional jumper bars can be purchased by using catalog number 1756-JMPR.

Daisy Chain to Other RTBs

See page 262 for proximity sensor wiring.
The following diagram shows how to wire a proximity sensor to the module’s eight counters or eight hardware inputs. Counters use incoming pulses for counts and frequency with two user-configurable On/Off windows per counter. Hardware inputs provide standard input or counter-control functionality.

1756 Removable Terminal Blocks

Removable terminal blocks (RTBs) provide a flexible interconnection between your plant wiring and 1756 I/O modules. The RTB plugs into the front of the I/O module. The type of module determines which RTB you need. You can choose screw-clamp or spring-clamp RTBs.

RTBs are not shipped with I/O modules. You must order them separately. The standard housing on the front of the wiring arm is not deep enough for 2.5 mm\(^2\) (14 AWG) wiring. If you plan to use 2.5 mm\(^2\) (14 AWG) wiring, also order the extended housing.

**ATTENTION:** If separate power sources are used, do not exceed the specified isolation voltage: referring to the specifications for each individual module on the preceding pages.

**WARNING:** Do not use the 1756-TBNHS, 1756-TBSHS, 1756-TBCHS, 1756-TBS6HS safety RTBs, and the 1756-TBE Extended-depth terminal block housing on non-safety I/O modules.

### RTB Specifications - 1756-TBNH, 1756-TBNHS, 1756-TBSH, 1756-TBSHS, 1756-TBCH, 1756-TBCHS, 1756-TBS6H, 1756-TBS6HS, 1756-TBE, 1756-TBES

Wiring Systems

As an alternative to buying RTBs and connecting the wires yourself, you can buy a wiring system of the following:

- Interface modules (IFMs) that provide the output terminal blocks for digital I/O modules. Use the pre-wired cables that match the I/O module to the IFM.

- Analog interface modules (AIFMs) that provide the output terminal blocks for analog I/O modules. Use the pre-wired cables that match the I/O module to the AIFM.

- I/O module-ready cables. One end of the cable assembly is an RTB that plugs into the front of the I/O module. The other end has individually color-coded conductors that connect to a standard terminal block.
