

# Kinetix 7000 High Power Servo Drive

Catalog Numbers 2099-BM06-S, 2099-BM07-S, 2099-BM08-S, 2099-BM09-S, 2099-BM10-S, 2099-BM11-S, 2099-BM12-S

# **Important User Information**

Read this document and the documents listed in the additional resources section about installation, configuration, and operation of this equipment before you install, configure, operate, or maintain this product. Users are required to familiarize themselves with installation and wiring instructions in addition to requirements of all applicable codes, laws, and standards.

Activities including installation, adjustments, putting into service, use, assembly, disassembly, and maintenance are required to be carried out by suitably trained personnel in accordance with applicable code of practice.

If this equipment is used in a manner not specified by the manufacturer, the protection provided by the equipment may be impaired.

In no event will Rockwell Automation, Inc. be responsible or liable for indirect or consequential damages resulting from the use or application of this equipment.

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variables and requirements associated with any particular installation, Rockwell Automation, Inc. cannot assume responsibility or liability for actual use based on the examples and diagrams.

No patent liability is assumed by Rockwell Automation, Inc. with respect to use of information, circuits, equipment, or software described in this manual.

Reproduction of the contents of this manual, in whole or in part, without written permission of Rockwell Automation, Inc., is prohibited.

Throughout this manual, when necessary, we use notes to make you aware of safety considerations.

**WARNING:** Identifies information about practices or circumstances that can cause an explosion in a hazardous environment, which may lead to personal injury or death, property damage, or economic loss.

**ATTENTION:** Identifies information about practices or circumstances that can lead to personal injury or death, property damage, or economic loss. Attentions help you identify a hazard, avoid a hazard, and recognize the consequence.

**IMPORTANT** Identifies information that is critical for successful application and understanding of the product.

These labels may also be on or inside the equipment to provide specific precautions.

**SHOCK HAZARD:** Labels may be on or inside the equipment, for example, a drive or motor, to alert people that dangerous voltage may be present.

**BURN HAZARD:** Labels may be on or inside the equipment, for example, a drive or motor, to alert people that surfaces may reach dangerous temperatures.

**ARC FLASH HAZARD:** Labels may be on or inside the equipment, for example, a motor control center, to alert people to potential Arc Flash. Arc Flash will cause severe injury or death. Wear proper Personal Protective Equipment (PPE). Follow ALL Regulatory requirements for safe work practices and for Personal Protective Equipment (PPE).

| Updated UKCA Agency Certification                               | 154        |

# **About This Publication**

This manual provides detailed installation instructions for mounting, wiring, and troubleshooting your Kinetix\* 7000 drive, and system integration for your drive/motor combination with a Logix controller.

## **Who Should Use This Manual**

This manual is intended for engineers or technicians directly involved in the installation and wiring of the Kinetix 7000 drive, and programmers directly involved in the operation, field maintenance, and integration of the Kinetix 7000 drive with a Sercos interface module.

If you do not have a basic understanding of the Kinetix 7000 drive, contact your local Rockwell Automation sales representative before using this product for the availability of training courses.

# Conventions Used in This Manual

These conventions are used throughout this manual.

- Bulleted lists such as this one provide information, not procedural steps.
- Numbered lists provide sequential steps or hierarchical information.

## **Additional Resources**

The following documents contain additional information concerning related products from Rockwell Automation. You can view or download publications at rok.auto/literature.

# **About the Drive System**

The Kinetix 7000 high-power servo drive is designed to provide a Kinetix $^{\circ}$  Integrated Motion solution for applications with output power requirements in the range of 22...149 kW (40...248 A).

Table 1 - Kinetix 7000 Drive System Overview

| Kinetix 7000<br>Component    | Catalog Numbers  | Description  |  |
|------------------------------|--|--|--|
| Servo Drive                  | 2099-BMxx-S <sup>(1)</sup>   | The Kinetix 7000 servo drive with Safe Torque Off feature is available with 460V AC input power, or capable of operating with a shared DC bus.   |  |
| Regenerative Power<br>Supply | 8720MC-RPS   | The 8720MC-RPS is a sinusoidal PWM converter that may serve as a regenerative power supply for one or more drives.   |  |
| Logix Controller<br>Platform | 1756-L60M03SE module<br>1756-MxxSE module<br>1768-M04SE module<br>1784-PM16SE PCI card | The Sercos interface module/PCI card serves as a link between the ControlLogix®/CompactLogix™/SoftLogix™ platform and Kinetix 7000 drive system. The communication link uses the IEC 61491 SErial Real-time COmmunication System (Sercos) protocol over a fiber-optic cable.   |  |
| RSLogix 5000®<br>Software    | 9324-RLD300ENE   | RSLogix 5000 software provides support for programming, commissioning, and maintaining the Logix family of controllers.  |  |
| Rotary Servo Motors          | Kinetix MPL, MPM, HPK,<br>RDB, and MMA   | Compatible rotary servo motors include Kinetix MPM and MPL 400V-class motors, Kinetix HPK, MMA, and RDB motors.  |  |
| Cables                       | Motor Power, Feedback, and<br>Brake cables   | Kinetix 2090 motor power/brake and feedback cables are available with bayonet, threaded, and Circular DIN connectors. Power/brake cables have flying leads on the drive end and straight connectors that connect to servo motors. Feedback cables have flying leads that wire to low-profile connector kits on the drive end and straight connectors on the motor end. |  |
|                              | Communication  | Large power motors may require user power wiring to handle larger current requirements.  |  |
|                              | Communication  | Kinetix 2090 Sercos fiber-optic cables are available as enclosure only, PVC, nylon, and glass with connectors at both ends.  |  |
| AC Line Filters              | 2090-XXLF-TCxxxx   | 2090-XXLF-TCxxxx three-phase AC line filters are required to meet CE and UK and available for use in all Kinetix 7000 drive systems.   |  |
| Line Interface Module        | 2094-BL50/75S, or 2094-<br>XL75S-Cx  | The line interface module (LIM) contains the circuit breakers, power supplies, and safety contactor required for Kinetix 7000 operation. Individual components can be purchased separately in place of the LIM.  |  |
| External Shunt<br>Modules    | NA   | See External Shunt Modules on page 157 for active shunt solutions from Rockwell Automation® Encompass™ partners and intended for use with Kinetix 7000 drives.   |  |

<sup>(1)</sup> See the Kinetix Safe Torque Off Feature Safety Reference Manual, publication <u>GMC-RM002</u>, for more information.

# Typical Drive System Diagrams

Typical Kinetix 7000 system installations include three-phase AC configurations, with and without the line interface module (LIM), and DC common bus configurations.

Figure 2 - Kinetix 7000 System Configuration without Line Interface Module (LIM)

The Kinetix 7000 drive system that is shown in Figure 3 illustrates a regenerative power only configuration with a 8720MC regenerative power supply (RPS). The harmonic filter and varistor are available separately, but are included with the RPS unit when ordering the 8720MC-RPS065BM-HV2. In this configuration, the Kinetix 7000 drive provides motoring power and the 8720MC-RPS065 provides regenerative power.

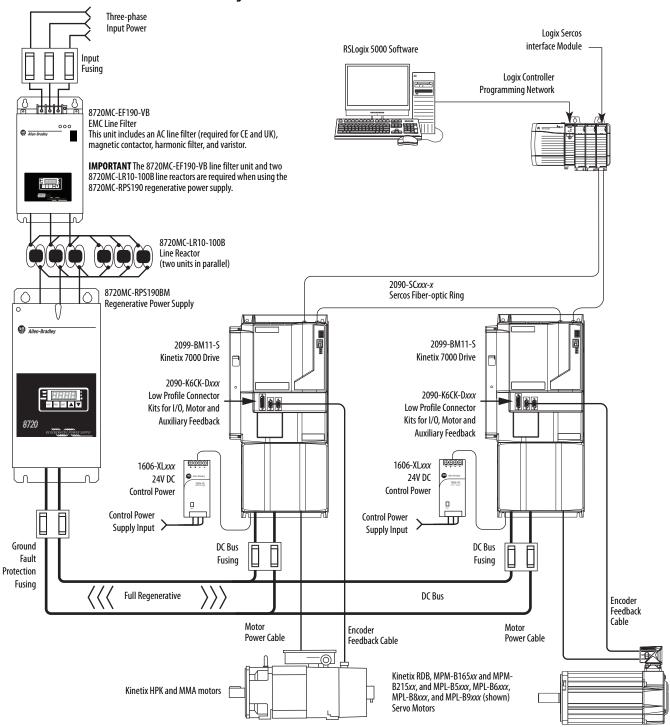

Figure 3 - Kinetix 7000 System Configuration with AC Input and Regenerative Power Supply

Kinetix 7000 Drive

(required for CE and UK)

The Kinetix 7000 drive system that is shown in Figure 4 illustrates a DC common bus configuration with two follower Kinetix 7000 (2099-BM11-S) drives and an 8720MC regenerative power supply (RPS). In full-line regenerative mode the 8720MC-RPS190 unit provides motoring and regenerative power.

Figure 4 - Kinetix 7000 System Configuration with AC Input and 8720MC-RPS190 with Full-line Regeneration

The Kinetix 7000 drive system that is shown in Figure 5 illustrates a DC common bus configuration with two follower Kinetix 7000 drives and an 8720MC regenerative power supply (RPS). The harmonic filter and varistor are available separately, but are included when ordering the 8720MC-RPS065BM-HV2 RPS unit. In full-line regenerative mode the 8720MC-RPS065BM-HV2 unit provides motoring power and regenerative power. In common bus mode, you must calculate the total bus capacitance of your DC common bus system. This lets you plan your panel layout and sufficiently size the 8720MC-RPS to precharge the entire system.

# **Catalog Number Explanation**

Kinetix 7000 drive catalog numbers and descriptions are listed in the table below.

| Kinetix 7000 Drive                                  | Cat. No.    |
|---|-------------|
| Kinetix 7000, 460V, 22 kW, 40 A continuous output   | 2099-BM06-S |
| Kinetix 7000, 460V, 30 kW, 52 A continuous output   | 2099-BM07-S |
| Kinetix 7000, 460V, 37 kW, 65 A continuous output   | 2099-BM08-S |
| Kinetix 7000, 460V, 56 kW, 96 A continuous output   | 2099-BM09-S |
| Kinetix 7000, 460V, 75 kW, 125 A continuous output  | 2099-BM10-S |
| Kinetix 7000, 460V, 112 kW, 180 A continuous output | 2099-BM11-S |
| Kinetix 7000, 460V, 149 kW, 248 A continuous output | 2099-BM12-S |

# **Agency Compliance**

If this product is installed within the European Union or EEC regions and has the CE marking, or within the United Kingdom and has the UKCA marking, the following regulations apply.

**ATTENTION:** Meeting CE and UK requires a grounded system, and the method of grounding the AC line filter and drive must match. Failure to do this renders the filter ineffective and may cause damage to the filter.

For grounding examples, see **Grounded Power Configurations** on page 73.

For more information on electrical noise reduction, see the System Design for Control of Electrical Noise Reference Manual, publication <u>GMC-RM001</u>.

#### **CE and UK Requirements - System without LIM**

To meet CE and UK requirements when your Kinetix 7000 system does not use a 2094 line interface module to supply AC line and DC control power, the following requirements apply:

- Install an 8720MC-RF180 line filter as close to the 8720MC-RPS unit as possible, and the AC line filter (2090-XXLF-TCxxxx) as close to the Kinetix 7000 drive as possible.
- For Kinetix MPx motors, use Kinetix 2090 motor power cables or use connector kits. Terminate cable shields at the chassis and the motor terminal block with a 360° connection.
- For Kinetix HPK and MMA motors, use UL Approved 4 wire, 600V AC, shield, VFD cabling. Terminate cable shields at the chassis and the motor with a 360° connection.
- Combined motor power/feedback cables must not exceed 90 m (295.3 ft).
- Use Kinetix 2090 motor feedback cables or connector kits and terminate
  the feedback shield as shown in <u>Chapter 4</u> for wiring instructions and
  <u>Appendix B</u> for motor feedback connector kit catalog numbers. Drive to
  motor feedback cables must not exceed 90 m (295.3 ft).
- Install the Kinetix 7000 system inside an enclosure. Run input power wiring in conduit (grounded to the enclosure) outside of the enclosure. Separate signal and power cables.
- Output power, control (I/O), and signal wiring must be braided, shielded cable with a coverage of 75% or better, metal conduit or equivalent attenuation.
- All shielded cables should terminate with a properly shielded connector.

See the System Design for Control of Electrical Noise Reference Manual, publication <u>GMC-RM001</u>, for information on electrical noise reduction and grounding practices.

#### **CE and UK Requirements - System with LIM**

To meet CE and UK requirements when your Kinetix 7000 system includes the line interface module (LIM), follow all the requirements as stated in CE and UK Requirements - System without LIM on page 17 and these additional requirements that also apply to the AC line filter:

• Install the LIM, 2094-XL75S-Cx or 2094-BL50/75S, and line filter (2090-XXLF-TCxxx) as close to the Kinetix 7000 drive as possible.

#### **IMPORTANT**

The full rated current on the AC input line should not exceed that of the line interface module.

Catalog numbers 2094-XL75S-Cx or 2094-BL50S for 2099-BM06-S and 2099-BM07-S Kinetix 7000 drives, or 2094-BL75S for 2099-BM08-S Kinetix 7000 drives.

#### **IMPORTANT**

CE and UK require use of a grounded secondary or source with a 2099-BMxx-S drive.

Never use a LIM in an ungrounded input, due to the potential for high line-to-neutral voltages damaging components within the line filter.

# CE and UK Requirements - System with DC Common Bus Through 8720MC-RPS

To meet CE and UK requirements when your Kinetix 7000 system includes a common DC bus with an 8720MC-RPS, follow all the requirements as stated in the CE and UK Requirements - System without LIM on page 17, the recommended installation and wiring in the 8720MC Regenerative Power Supply Reference Manual, publication 8720MC-RM001, and these additional requirements:

- Install a three-phase line filter on the AC input power line of the RPS as indicated in Interconnect Diagrams beginning on page 161.
- Install a single-phase line filter when attaching an AC line input to the RPS MC1/2 circuit as indicated in the Interconnect Diagrams beginning on page 161.

# **Install the Kinetix 7000 Drive System**

This chapter describes system installation guidelines in preparation for mounting your Kinetix 7000 drive components.

| Торіс                        |    |  |  |
|------------------------------|----|--|--|
| System Design Guidelines     |    |  |  |
| Minimizing Electrical Noise  | 26 |  |  |
| Mount the Kinetix 7000 Drive | 37 |  |  |

**ATTENTION:** Plan the installation of your system so that you can perform all cutting, drilling, tapping, and welding with the system removed from the enclosure. Because the system is of the open type construction, be careful to keep any metal debris from falling into it. Metal debris or other foreign matter can become lodged in the circuitry, which can result in damage to components.

# **System Design Guidelines**

To design your enclosure and plan where to mount the system components on the panel, use this section and the information in the Kinetix® Servo Drives Specifications Technical Data, publication KNX-TD005.

For online product selection and system configuration tools see: <a href="https://configurator.rockwellautomation.com/">https://configurator.rockwellautomation.com/</a>.

## **System Mounting Requirements**

Follow these system mounting requirements.

- To comply with UL and CE and UK requirements, the Kinetix 7000 drive system must be enclosed in a grounded conductive enclosure offering protection as defined in standard EN 60529 (IEC 529) to NEMA/UL Type IP2X such that they are not accessible to an operator or unskilled person. A NEMA/UL Type 4X enclosure exceeds these requirements providing protection to IP66.
- The panel that you install inside the enclosure for mounting your system
  components must be on a flat, rigid, vertical surface that won't be subjected
  to shock, vibration, moisture, oil mist, dust, or corrosive vapors (as
  specified in Environmental Specifications on page 155).
- Size the drive enclosure so as not to exceed the maximum ambient temperature rating. Consider heat dissipation specifications for all drive components.
- Isolate input power wiring and motor power cables from control wiring and motor feedback cables. Use shielded cable for power wiring and provide a grounded 360° clamp termination.
- Use high-frequency (HF) bonding techniques to connect the modules, enclosure, machine frame, and motor housing, and to provide a lowimpedance return path for HF energy and reduce electrical noise.

See the System Design for Control of Electrical Noise Reference Manual, publication <u>GMC-RM001</u>, to better understand the concept of electrical noise reduction.

#### Transformer Selection

The Kinetix 7000 drive does not require an isolation transformer for three-phase input power. However, a transformer may be required to match the voltage requirements of the controller to the available service.

To size a transformer for the AC power inputs to devices peripheral to the Kinetix 7000 drive, refer to the manufacturer continuous output power specification.

**IMPORTANT** 

If using an autotransformer, make sure that the phase to neutral/ground voltages do not exceed the input voltage ratings of the drive.

#### **IMPORTANT**

Use a form factor of 1.5 for three-phase power (where form factor is used to compensate for transformer, drive module and motor losses, and to account for utilization in the intermittent operating area of the torque speed curve). For example: using a secondary of 480V AC and a 2099-BM06-S with a rated power output = 22 kW continuous:

22 \* 1.5 = 33 kVA transformer

#### **Circuit Breaker/Fuse Selection**

The Kinetix 7000 drive uses internal solid-state motor short-circuit protection and, when protected by suitable branch circuit protection, are rated for use on a circuit capable of delivering up to 200,000 A. Fuses or circuit breakers, with adequate withstand and interrupt ratings, as defined in NEC or applicable local codes, are permitted.

The 2094-BL50 and 2094-BL75S LIMs contain supplementary protection devices, but require a customer-supplied external line filter. See the Line Interface Module Installation Instructions, publication 2094-IN005, for power specifications and more information on using the LIM module.

The 140M/MT Motor Protection Circuit Breakers (MPCBs) are another acceptable means of protection. As with fuses and circuit breakers, you must make sure that the selected components are properly coordinated and meet applicable codes including any requirements for branch circuit protection. When applying the 140M/MT MPCB, evaluation of the short circuit available current is critical and must be kept below the short circuit rating of the 140M/MT MPCB.

In most cases, fuses that are selected to match the drive input current rating will meet the NEC requirements and provide the full drive capabilities. Dual element, time delay (slow acting) fuses should be used to avoid spurious trips during the inrush current of power initialization.

See Circuit Breaker/Fuse Specifications on page <u>151</u> for recommended circuit breakers and fuses.

See Power Specifications on page <u>150</u> for input current and inrush current specifications for your Kinetix 7000.

#### **Enclosure Selection**

To assist you in sizing an enclosure, the following example is provided. The example system consists of the following components.

- 2-axis Kinetix 7000 servo drive system
- ControlLogix® chassis and modules

Size the Kinetix 7000 servo drive using Motion Analyzer software, version 4.2 or later, and use the results to predict the amount of heat dissipated into the enclosure. You will also need heat dissipation data from other equipment inside the enclosure (such as ControlLogix). Once the total amount of heat dissipation (in watts) is known, the minimum enclosure size can be calculated. It is recommended that you also contact the enclosure manufacturer for the best enclosure fit, including possible cooling methods to help reduce enclosure size.

#### Using Motion Analyzer to Determine Heat Dissipation

To obtain Motion Analyzer software, go to: https://www.rockwellautomation.com/en-us/products/software/factorytalk/designsuite/motion-analyzer.html

Complete the Motion Analyzer Axis View data to find an acceptable Kinetix 7000 drive and motor solution to meet the application needs. In the Axis View Solutions window find the Drive Capacity value. In this example, the 2099-BM11-S Drive Capacity characteristic can be used for the estimation of the Rated Power Output that is used for the percentage of watts dissipated.

Table 2 - Kinetix 7000 System Heat Dissipation Example

| Enclosure<br>Component               | Description              | <b>Loading</b> <sup>(1)</sup> (Motion Analyzer) | Heat Dissipation <sup>(2)</sup> Watts |
|--------------------------------------|--------------------------|---|---------------------------------------|
| 2099-BM08-S                          | Kinetix 7000 Servo Drive | 50%   | 452                                   |
| 2099-BM11-S                          | Kinetix 7000 Servo Drive | 50%   | 1275                                  |
| Total Wattage of Kinetix 7000 system |                          |   | 1727                                  |

<sup>(1)</sup> Loading determined using Motion Analyzer software.

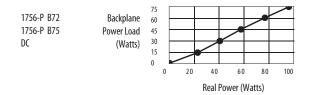

(2) To determine heat dissipation specifications for the Kinetix 7000 drive, see <u>Power Dissipation</u> <u>Specifications</u> on page 152.

**Table 3 - ControlLogix Heat Dissipation Example** 

| Enclosure<br>Component                     | Description                      | Backplane Power Load <sup>(1)</sup><br>Watts | Heat Dissipation <sup>(1)</sup><br>Watts |  |

| Total ControlLogix                         | system wattage                   | •  | 34.1                                     |  |

<sup>(1)</sup> For ControlLogix module specifications, see the ControlLogix Selection Guide, publication <u>1756-SG001</u>.

Figure 6 - ControlLogix Real Power

For backplane power loading requirements of other ControlLogix power supplies, see the ControlLogix Selection Guide, publication <u>1756-SG001</u>.

<sup>(2)</sup> Real power heat dissipation is determined by applying the backplane power load (17.18 W) to the graph in Figure 6.

In this example, the amount of power that is dissipated inside the cabinet is the sum of the Kinetix 7000 drive (2099-BM08-S and 2099-BM11-S) system value (1727 W) and the ControlLogix value (34.1 W) for a total of 1761 W.

With no active method of heat dissipation (such as fans or air conditioning) either of the following approximate equations can be used.

| Metric  | Standard English   |  |  |  |  |
|---|--|--|--|--|--|
| $A = \frac{0.38Q}{1.8T - 1.1}$  | $A = \frac{4.08Q}{T - 1.1}$  |  |  |  |  |
| Where T is temperature difference between inside air and outside ambient (°C), Q is heat that is generated in enclosure (Watts), and A is enclosure surface area (m²). The exterior surface of all six sides of an enclosure is calculated as | Where T is temperature difference between inside air and outside ambient (°F), Q is heat that is generated in enclosure (Watts), and A is enclosure surface area (ft2). The exterior surface of all six sides of an enclosure is calculated as |  |  |  |  |
| A = 2dw + 2dh + 2wh   | A = (2dw + 2dh + 2wh) / 144  |  |  |  |  |
| Where d (depth), w (width), and h (height) are in meters.   | Where d (depth), w (width), and h (height) are in inches.  |  |  |  |  |

The maximum ambient rating of the Kinetix 7000 drive is 50 °C (122 °F) and if the maximum environmental temperature is 30 °C (86 °F) then Q=1761 and T=20 in this equation.

$$A = \frac{0.38 (1761)}{1.8 (20) - 1.1}$$

$$A = 19.2 \, \text{m}^2$$

In this example, the enclosure must have an exterior surface of 19.2 m<sup>2</sup>. If any portion of the enclosure is not able to transfer heat, it should not be included in the calculation. For instance, if an externally mounted shunt system is used with the Kinetix 7000 system, it should not be included in the equation.

The minimum enclosure size must take into account the physical size and minimum clearance requirements of the two Kinetix 7000 drives and the additional ControlLogix and other devices that are required to meet the application needs.

If the enclosure size is considerably larger than what is necessary to house the system components, it may be more efficient to provide a means of cooling in a smaller enclosure. Contact your enclosure manufacturer for options available to cool your enclosure.

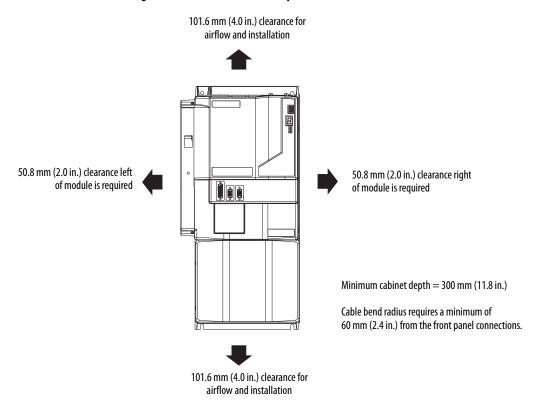

# **Minimum Clearance Requirements**

This section provides information to assist you in sizing your cabinet and positioning your Kinetix 7000 system components.

**IMPORTANT** 

Mount the module in an upright position as shown. Do not mount the module on its side.

Figure 7 - Minimum Clearance Requirements

See page 152 for power dissipation specifications.

# **Minimizing Electrical Noise**

This section outlines best practices that minimize the possibility of noise-related failures as they apply specifically to Kinetix 7000 drive installations. For more information on the concept of high-frequency (HF) bonding, the ground plane principle, and electrical noise reduction, see the System Design for Control of Electrical Noise Reference Manual, publication GMC-RM001.

## **Bonding Modules**

Bonding is the practice of connecting metal chassis, assemblies, frames, shields, and enclosures to reduce the effects of electromagnetic interference (EMI).

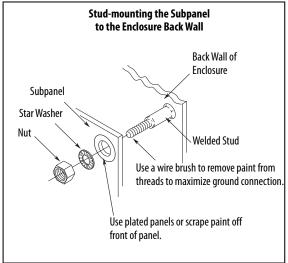

Unless specified, most paints are not conductive and act as insulators. To achieve a good bond between the drive and subpanel, surfaces must be unpainted or plated. Bonding metal surfaces creates a low-impedance return path for high-frequency energy.

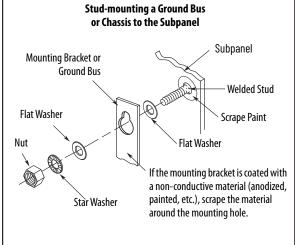

| IMPORTANT | To improve the bond between the drive and subpanel, construct your |
|-----------|--|
|           | subpanel out of zinc-plated (unpainted) steel.                     |

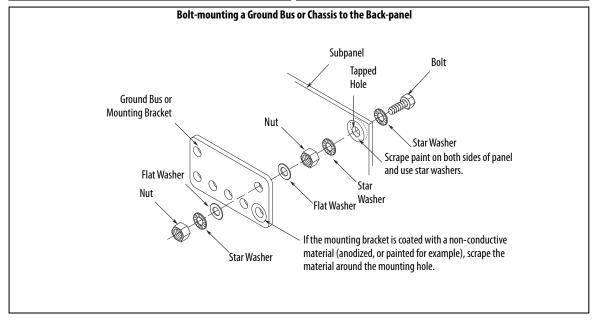

Improper bonding blocks the direct return path and routes high-frequency energy to elsewhere in the cabinet. Excessive high-frequency energy can affect the operation of other microprocessor-controlled equipment.

<u>Figure 8</u> shows details of recommended bonding practices for painted panels, enclosures, and mounting brackets.

Figure 8 - Recommended Bonding Practices for Painted Panels

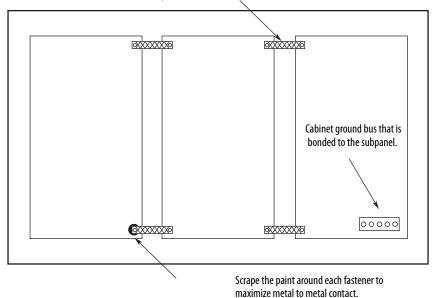

# **Bonding Multiple Subpanels**

Bonding multiple subpanels creates a common low impedance exit path for the high frequency energy inside the cabinet. Subpanels that are not bonded together may not share a common low impedance path. This difference in impedance may affect networks and other devices that span multiple panels.

Figure 9 - Multiple Subpanels and Cabinet Recommendations

**Establish Noise Zones** 

When designing a panel for a Kinetix 7000 system, observe the following guidelines with additional attention to zone locations.

Noise Zones when Using Regenerative Power Supplies (with/without a Line Filter Unit)

Observe the following guidelines when laying out a Kinetix 7000 system panel if a regenerative power supply (8720-RPSxxxxx) is used (see Figure 10), and if a regenerative power supply and line filter unit are used (see Figure 11 on page 30).

- Mount the regenerative power supply to the right of the drive.
- The clean zone (C) is beneath and left of the Kinetix 7000 drive. This zone includes the motor feedback, auxiliary feedback, and registration signals from the IOD connector (gray wireway).
- The dirty zone (D) is to the right of the Kinetix 7000 drive. This zone
  includes the motor power, GPIO, GPR, SO, and IOD connections (black
  wireway).
- The very dirty zone (VD) includes both the 8720MC-RPS DC output to the Kinetix 7000 drive and the fuses, contactors, circuit breakers, and AC line input to the EMC line filter to the right of the 8720MC-RPS. Shielded cable is required only if the very dirty cables enter a wireway.
- The Sercos fiber-optic cables are immune to electrical noise.

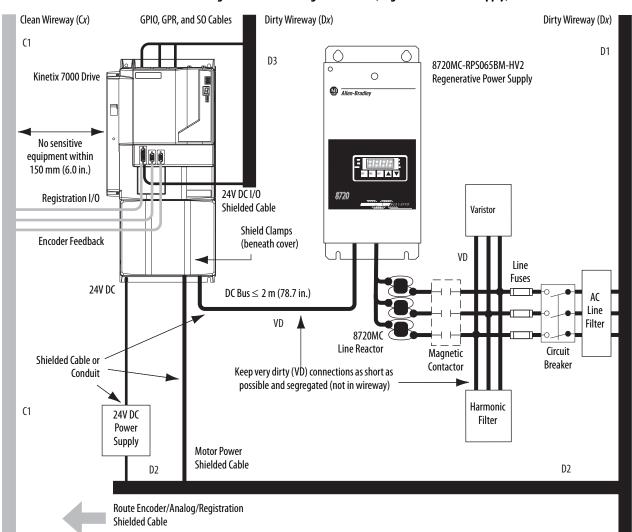

Figure 10 - Establishing Noise Zones (Regenerative Power Supply)

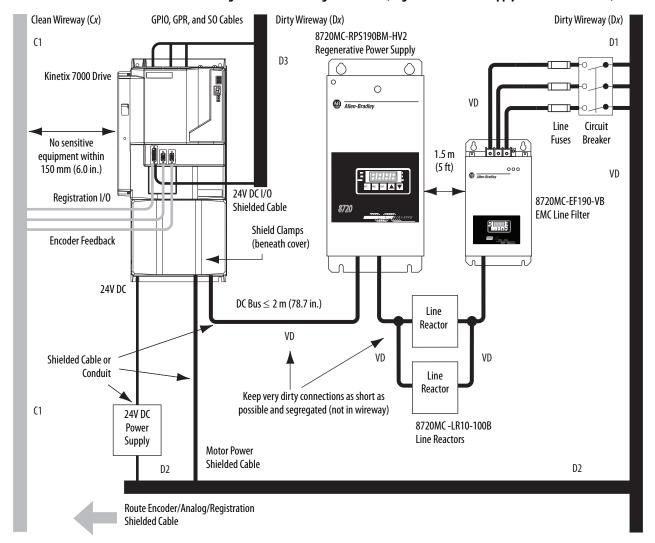

Figure 11 - Establishing Noise Zones (Regenerative Power Supply with Line Filter Unit)

#### AC Power Noise Zones

Observe the following guidelines when laying out a Kinetix 7000 system panel, if an AC power supply is used (and regenerative power will not be used).

- The clean zone (C) is beneath and left of the Kinetix 7000 drive. This zone includes the motor feedback, auxiliary feedback, and registration signals from the IOD connector (gray wireway).
- One dirty zone (D) is beneath and right of the Kinetix 7000 drive. This zone includes fuses, contactors, circuit breakers, AC line input to the EMC line filter (black wireway).
- The very dirty zone (VD) is limited to where the AC line output exits from the EMC line filter and connects to the Kinetix 7000 drive. Shielded cable is required only if the very dirty cables enter a wireway.
- The Sercos fiber-optic cables are immune to electrical noise.

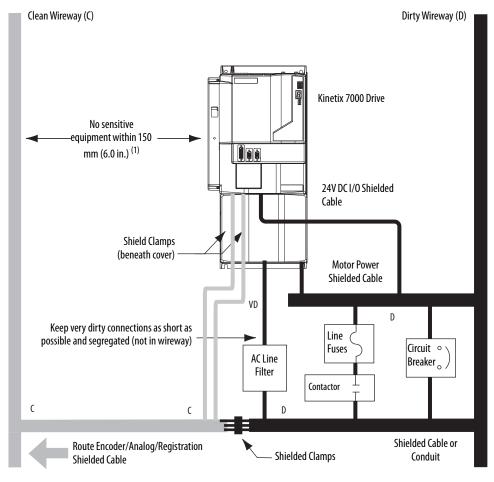

Figure 12 - Establishing Noise Zones (AC Power)

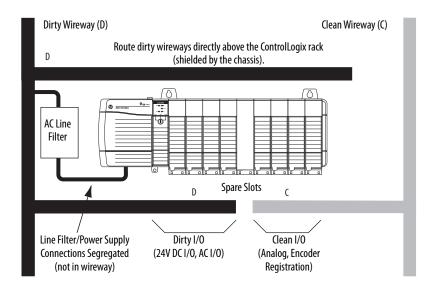

<sup>(1)</sup> When space does not permit the 150 mm (6.0 in.) partitioning, use a grounded steel shield instead. For examples, see the System Design for Control of electrical Noise Reference Manual, publication GMC-RM001.

#### 1756-MxxSE Sercos Interface Module Noise Zones

Observe the following guidelines when installing your 1756-MxxSE Sercos interface module.

- The clean zone (C) is beneath the less noisy I/O modules (analog, encoder, registration) - (gray wireway).
- The dirty zone (D) is above and below the power supply and noisy modules (black wireway).
- The Sercos fiber-optic cables are immune to electrical noise.

Figure 13 - Establishing Noise Zones (ControlLogix)

# **Cable Categories for Kinetix 7000 Systems**

The table below indicates the zoning requirements of input power cables connecting to the Kinetix 7000 drive.

Table 4 - Kinetix 7000 Drive

| Wire/Cable                    | Connector | Zone          |       | Method |                   |                   |
|-------------------------------|-----------|---------------|-------|--------|-------------------|-------------------|
|                               |           | Very<br>Dirty | Dirty | Clean  | Ferrite<br>Sleeve | Shielded<br>Cable |
| Control Power                 | СР        |               | Х     |        |                   |                   |
| DC-/DC+                       |           | Х             |       |        |                   |                   |
| L1, L2, L3 (shielded cable)   | PTB       |               | Х     |        |                   | Х                 |
| L1, L2, L3 (unshielded cable) |           | Х             |       |        |                   |                   |
| DPI™                          | DPI       |               |       | Х      |                   | Х                 |

The table below indicates the zoning requirements of power and control cables connecting to the Kinetix 7000 system.

Table 5 - Kinetix 7000 System

| Wire/Cable   | Connector | Zone          |        | Method |                   |                   |
|--|-----------|---------------|--------|--------|-------------------|-------------------|
|  |           | Very<br>Dirty | Dirty  | Clean  | Ferrite<br>Sleeve | Shielded<br>Cable |
| U, V, W (Motor Power)  | MP        |               | Х      |        |                   | Х                 |

#### **Noise Reduction Guidelines for Drive Accessories**

When mounting an AC (EMC) line filter or external shunt resistor refer to the sections below for guidelines that are designed to reduce system failures caused by excessive electrical noise.

#### AC Line Filters

Observe the following guidelines when mounting your AC (EMC) line filter.

See the Establishing Noise Zones (AC Power) on page 31 for an example.

- Mount the AC line filter on the same panel as the Kinetix 7000 drive and as close to the power input as possible.
- Good HF bonding to the panel is critical.

For painted panels, refer to the examples on page 27.

• Separate input and output wiring as far as possible.

#### **IMPORTANT**

CE and UK test certification applies only to the AC line filter and single drive. Sharing a line filter with multiple drives may perform satisfactorily, but the user takes legal responsibility.

#### Shunt Resistor

Observe the following guidelines when mounting your external shunt resistor outside the enclosure.

- Mount circuit components and wiring in the very dirty zone or in an
  external shielded enclosure. Run shunt power and fan wiring inside metal
  conduit to minimize the effects of EMI and RFI.
- Mount resistors (other than metal-clad) in a shielded and ventilated enclosure outside the cabinet
- Keep unshielded wiring as short as possible. Keep shunt wiring as flat to the cabinet as possible.
- Route thermal switch and fan wires separate from shunt power.

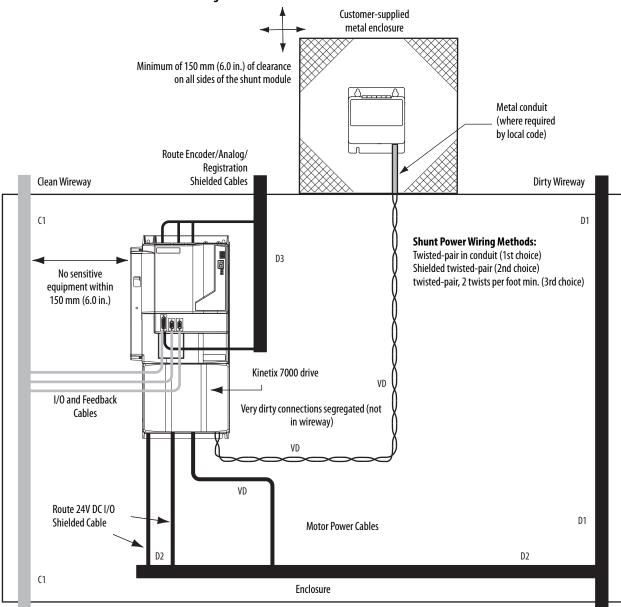

Figure 14 - External Shunt Resistor Outside the Enclosure

When mounting your shunt module inside the enclosure, follow these additional guidelines.

- Metal-clad modules can be mounted anywhere in the dirty zone, but as close to the Kinetix 7000 system as possible.
- Shunt power wires can be run with motor power cables.
- Keep unshielded wiring as short as possible. Keep shunt wiring as flat to the cabinet as possible.
- Separate shunt power cables from other sensitive, low voltage signal cables.
- The shunt module watts dissipation must be included in the Kinetix 7000 system heat dissipation calculation for selecting an enclosure.

Figure 15 - External Shunt Resistor Inside the Enclosure

#### Motor Brake and Thermal Switch

The thermal switch and brake are mounted inside the motor, but how you connect to the axis module depends on the motor series.

See Wire Motor Output Power on page <u>91</u> for wiring guidelines specific to your drive/motor combination, and to <u>Interconnect Diagram Notes</u> on page <u>162</u> for the interconnect diagram of your drive/motor combination.

## **Mount the Kinetix 7000 Drive**

**SHOCK HAZARD:** To avoid hazard of electrical shock, perform all mounting and wiring of the drive before applying power. Once power is applied, connector terminals may have voltage present even when not in use.

**ATTENTION:** Plan the installation of your system so that you can perform all cutting, drilling, tapping, and welding with the system removed from the enclosure. Because the system is of the open type construction, be careful to keep any metal debris from falling into it. Metal debris or other foreign matter can become lodged in the circuitry, which can result in damage to components.

Follow these steps to install your Kinetix 7000 drive.

1. Layout and mark the position for your drive in the enclosure.

Follow the Kinetix 7000 mounting information provided in <u>Figure 16 on page 38</u>. Clearance requirements on page <u>25</u> must also be followed.

2. Attach the drive to the cabinet.

The recommended mounting bolts are listed in the table on page <u>38</u>. Follow the recommended high-frequency (HF) bonding techniques as shown in <u>Bonding Modules</u> beginning on page <u>26</u>.

Follow the lifting instructions found in the Kinetix 7000 High Power Servo Drive Installation Instructions, publication 2099-IN003.

**3.** Tighten all mounting fasteners.

Figure 16 - Kinetix 7000 Approximate Mounting Dimensions

## Digital and Analog Input/Output (IOD) Connector Pinout

The following diagram and table provide the signal description and pin-out information for the 26-pin Digital and Analog Input/Output connector.

See Kinetix\* 7000 Front Panel Connectors and Displays on page 40 for the location of the 26-pin connector. IOD signals are described in greater detail later in this chapter.

Figure 20 - Pin Orientation for 26-pin I/O (IOD) Connector

<sup>(1)</sup> Not applicable unless the motor has integrated thermal protection.

<sup>(2)</sup> Encoder power supply uses either 5V or 9V DC based on encoder/motor used.

 $<sup>(1) \</sup>quad \text{Not applicable unless motor has integrated thermal protection.} \\$ 

<sup>(2)</sup> Encoder power supply uses either 5V or 9V DC based on encoder/motor used.

Kinetix 7000 drives do not natively support EnDat absolute encoders. However, you can use the drive motor feedback connection with the 2090-K7CK-KENDAT feedback module to convert EnDat sine/cosine absolute encoder from a Kinetix RDB or MMA motor. Use the table below to connect the motor feedback wires to the 2090-K7CK-KENDAT feedback module. See Low-profile EnDat Feedback Modules, publication 2090-IN020 for additional information.

**IMPORTANT** 

Only 2099-BMxx-S drives with firmware revision 1.104 or higher support the use of 2090-K7CK-KENDAT feedback modules.

Table 13 - Connections for EnDat

<sup>(1)</sup> Kinetix 7000 drives do not support incremental encoders; compatibility with Kinetix 7000 drives is limited to Hiperface and EnDat sine/cosine encoders.

<sup>(1)</sup> Not applicable unless motor has integrated thermal protection.

<sup>(2)</sup> S1 = 1024 sin/cos, Absolute Single-turn Encoder (Hiperface protocol), S3 = 2048 sin/cos, Absolute Single-turn Encoder (EnDat protocol), M1 = 1024 sin/cos, Absolute Multi-turn Encoder (Hiperface protocol), M3 = 2048 sin/cos Absolute Multi-turn Encoder (EnDat protocol)

<sup>(3)</sup> Additional modifications may be needed to convert the drive 5V power to receive the Kinetix MMA 9V power.

## **Auxiliary Feedback (AF) Connector Pinouts**

For TTL devices, the position count will increase when A leads B. For sinusoidal devices, the position count increases when cosine leads sine.

Figure 24 - Pin Orientation for 15-pin Auxiliary Feedback (AF) Connector

## Safe Torque Off (STO) Terminal Block Connections

Figure 25 - Safe Torque Off (STO) Terminal Block

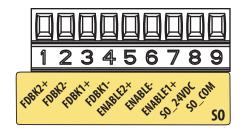

Table 17 - Safe Torque Off (STO) Terminal Block

| Terminal | Description   | Signal Name |
|----------|---|-------------|
| 1        | Normally closed monitoring contact for safety relay 2 | FDBK2+      |
| 2        | Return for safety relay 2                             | FDBK2-      |
| 3        | Normally closed monitoring contact for safety relay 1 | FDBK1+      |
| 4        | Return for safety relay 1                             | FDBK1-      |
| 5        | Coil of safety relay 2                                | ENABLE2+    |
| 6        | Common for safety relays 1 and 2                      | ENABLE-     |
| 7        | Coil of safety relay 1                                | ENABLE1+    |
| 8        | 24V DC, 500 mA max., power for Safe Off circuit       | SO_24VDC    |
| 9        | Common for 24V power Safe off circuit                 | SO_COM      |

| IMPORTANT | Terminals 8 and 9 (24V+ and Common) are only used by the motion-       |
|-----------|--|
|           | allowed jumper. When using the Safe Torque Off feature, the 24V supply |
|           | must come from an external source.                                     |

### **Control Power (CP) Terminal Block Connections**

Kinetix 7000 drives must be wired to a 24V DC control power source through the Control Input Power (CP) connector. The Control Power input terminal is on the bottom of the drive as illustrated in Figure 19 on page 42.

**IMPORTANT** An external power supply provides the ability to retain control of the drive's logic independent of its bus power status.

Figure 26 - Control Power (CP) Terminal Block Detail

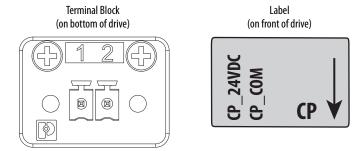

Table 18 - Control Power (CP) Terminal Block

| Terminal | Description                 | Signal Name |
|----------|-----------------------------|-------------|
| 1        | Control Power 24V DC Input  | CP_24VDC    |
| 2        | Control rower 24v DC IIIput | CP_COM      |

## **Power Terminal Block (PTB) Connections**

The power terminals are located behind the lower front panel of the drive. The figures below identify the input power, motor power, DC bus, ground, and cooling fan input terminals.

The 2099-BM09-S or 2099-BM10-S drives (frame 5), and the 2099-BM11-S or 2099-BM12-S drives (frame 6) provide connections for you to supply 120V AC or 240V AC to power an internal cooling fan. The fan VA rating is 100 VA for 2099-BM09-S and 2099-BM10-S, and 138 VA for the 2099-BM11-S and 2099-BM12-S drives.

The 2099-BM06-S, 2099-BM07-S, and 2099-BM08-S drives (frame 3) use the internal power supply for fan power and thus no terminals are provided.

Figure 27 - 2099-BM06-S, 2099-BM07-S, and 2099-BM08-S

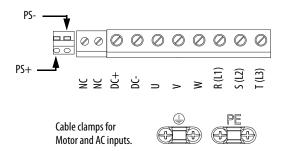

Figure 28 - 2099-BM09-S

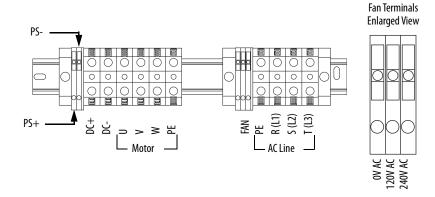

Figure 29 - 2099-BM10-S

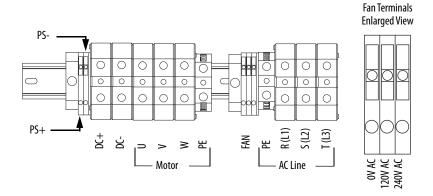

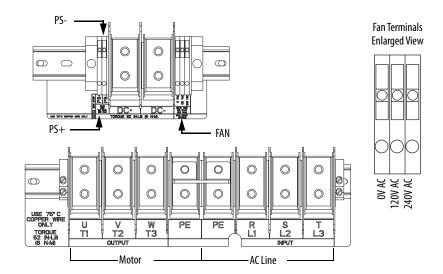

Figure 30 - 2099-BM11-S and 2099-BM12-S

## **Control Signal Specifications**

This section provides specifications for the Kinetix 7000 drive input/output (IOD), Sercos, motor feedback (MF), auxiliary feedback (AF), and brake (BC) connectors.

## **Digital Inputs (IOD Connector)**

Two fast registration inputs and four other inputs are available for the machine interface on the Kinetix 7000 drive. The drive supplies 24V DC @ 300 mA for registration, home, enable, overtravel positive, and overtravel negative inputs. These are sinking inputs that require a sourcing device. A 24V DC power and common connection is provided for each input.

| IMPORTANT | To improve registration input EMC performance, see the System Design for     |
|-----------|--|
|           | Control of Electrical Noise Reference Manual, publication <u>GMC-RM001</u> . |

#### **Table 20 - Digital Input Descriptions**

| IOD Pin          | Signal       | Description   | Capture Time | Edge/Level<br>Sensitive |
|------------------|--------------|---|--------------|-------------------------|
| IOD-2            | ENABLE       | Single optically isolated, single-ended active high signal. Current loading is nominally 10 mA. A 24V DC input is applied to this terminal to enable each axis.   | 20 ms        | Level                   |
| IOD-5            | НОМЕ         | Single optically isolated, single-ended active high signal. Current loading is nominally 10 mA. Home switch (normally open contact) inputs for each axis require 24V DC (nominal).  | 20 ms        | Level                   |
| IOD-14<br>IOD-17 | REG1<br>REG2 | Fast registration inputs are required to inform the motor interface to capture the positional information with less than 3 $\mu$ s uncertainty. Single optically isolated, single-ended active high signal. Current loading is nominally 10 mA. A 24V DC input is applied to this terminal to enable each axis. | 500 ns       | Edge                    |
| IOD-8<br>IOD-11  | 0T+<br>0T-   | Overtravel detection is available as a dual-input, optically isolated, single-ended active high signal. Current loading is nominally 10 mA per input. The pos/neg limit switch (normally closed contact) inputs for each axis require 24V DC (nominal).   | 20 ms        | Level                   |

#### **Table 21 - Digital Input Specifications**

| Parameter         | Description   | Min    | Мах     | Leakage |
|-------------------|---|--------|---------|---------|
| ON-state voltage  | Voltage applied to the input, regarding IOCOM, to guarantee an ON-state.  | 10.8V  | 26.4V   | _       |
| ON-state current  | Current flow to guarantee an ON-state                                     | 3.0 mA | 10.0 mA | _       |
| OFF-state voltage | Voltage applied to the input, regarding IOCOM, to guarantee an OFF-state. | -1.0V  | 3.0V    | <1.5 mA |

#### 24V I/O Power

| IMPORTANT | Signals +24V_PWR and +24V_COM are a 24V DC source that can be used |
|-----------|--|
|           | only for the inputs that are listed below.                         |

The Kinetix 7000 drive provides 24V DC power @ 300 mA total for the HW\_Enable\_Pwr, Home\_Switch\_Pwr, Pos\_OverTravel\_Pwr, Neg\_OverTravel\_Pwr, Reg\_1\_Pwr, and Reg\_2\_Pwr inputs on the specific drive. The supply is protected with an automatically reset fuse. A temperature versus time curve automatically controls closing of the fuse.

A common mode choke filters the registration power connection. An additional common mode choke is provided for the remaining inputs.

#### Hardware Enable

The Hardware Enable input is an optically isolated (500V), single-ended, active high signal. A 24V DC input applied to this pin enables the drive.

The status of this digital input can be monitored in the axis servo drive tag in RSLogix™.

If the Drive Hardware Enable option is selected in Logix, an MSO (Motion Servo On) instruction must be executed in RSLogix software. This causes IOD-1 to supply 24V DC to IOD-2, and completes the enable circuit for servo loop and drive power structure.

If the Drive Hardware Enable option is not selected in Logix, an MSO instruction enables the drive without the need for a Drive Enable signal confirmation.

This input is level sensitive. See <u>Table 20</u> - <u>Digital Input Descriptions</u> and <u>Table 21</u> - <u>Digital Input Specifications</u> starting on page <u>52</u> for On/Off signal voltages and current levels.

Kinetix 7000 drive Hardware Enable functions and faults actions are programmed through RSLogix software. Kinetix 7000 dive firmware provides an additional 50 ms of debounce.

**ATTENTION:** Overvoltage protection is not provided for the Hardware Enable input signal.

It is recommended to use the on-drive power to power the Hardware Enable signal. If an external power source is used, you must take responsibility to be sure that the voltage/current does not exceed the rating of the input.

The schematic below depicts the Hardware Enable circuit. It is provided as a reference only.

Figure 31 - Hardware Enable Digital Input Circuit Diagram

+24V DC source (range) = 21.6V...26.4V (supplied by the drive, not to exceed 300 mA total).
 Maximum current input = 10 mA.

#### Home

The Home input is an optically isolated (500V), single-ended, active high signal. A 24V DC input applied to this pin by a normally open contact indicates that this axis is in the home position. Firmware provides an additional 50 ms of debounce.

You can configure the required Home type in the axis servo drive properties in RSLogix. You can monitor the Home input "on/off" status in the axis servo drive tag.

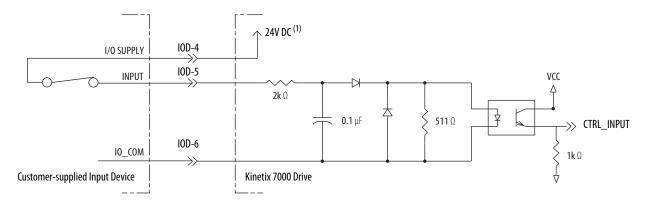

This input is level sensitive. See <u>Table 20</u> - <u>Digital Input Descriptions</u> and <u>Table 21</u> - <u>Digital Input Specifications</u> starting on page <u>52</u> for On/Off signal voltages and current levels.

**ATTENTION:** Overvoltage protection is not provided for the Home input signal. It is recommended to use the on-drive power to power the Home signal. If an external power source is used, you must take responsibility to be sure that the voltage/current does not exceed the rating of the input.

The schematic below depicts the Home circuit. It is provided as a reference only.

Figure 32 - Home Digital Input Circuit Diagram

+24V DC source (range) = 21.6...26.4V (supplied by the drive, not to exceed 300 mA total).
 Maximum current input = 10 mA.

#### Positive and Negative Overtravel

The Positive and Negative Overtravel detection is provided by two optically isolated (500V), single-ended, normally closed, active high signals. Breaking the 24V DC input at either pin indicates an overtravel condition.

You can enable hard travel limits on the axis servo drive Limit tab in RSLogix. Hard travel limits require power to both the positive and negative overtravel inputs. You can monitor the positive and negative overtravel input status in the axis servo drive tag.

#### Notes:

- A status of "1" indicates a normally closed input and a drive ready for movement.
- Hard overtravel limits can only be selected in a linear conversion selection.

This input is level sensitive. See <u>Table 20</u> - <u>Digital Input Descriptions</u> and <u>Table 21</u> - <u>Digital Input Specifications</u> starting on page <u>52</u> for On/Off signal voltages and current levels.

## **IMPORTANT** Overtravel limit input devices must be normally closed.

Kinetix 7000 drive Positive and Negative Overtravel functions and faults actions are programmed through RSLogix software. Kinetix 7000 drive firmware provides an additional 50 ms of debounce.

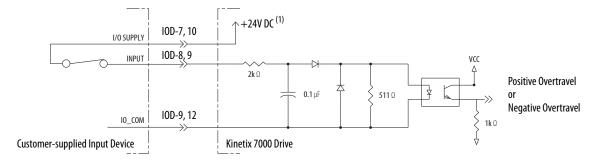

**ATTENTION:** Overvoltage protection is not provided for the Positive and Negative Overtravel input signal.

It is recommended to use the on drive power to power the Positive and Negative Overtravel signals. If an external power source is used, you must take responsibility to be sure that the voltage/current does not exceed the rating of the input.

The schematic below depicts the Positive and Negative Overtravel circuits. It is provided as a reference only.

Figure 33 - Positive and Negative Overtravel Input Diagram

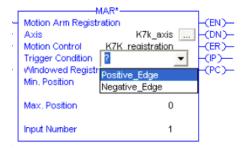

+24V DC source (range) = 21.6...26.4V (supplied by the drive, not to exceed 300 mA total).
 Maximum current input = 10 mA.

#### Registration

The two fast Registration inputs are provided on the Kinetix 7000 drive, Reg 1 (IOD-14) and Reg 2 (IOD-17). Unlike the Drive Enable, Home, and Overtravel signals, these inputs are either positive-edge or negative-edge triggered. They are based on the user-defined MAR (Motion Axis Registration) configured using RSLogix software.

Figure 34 - MAR (Motion Axis Registration) Entry in RSLogix Software

The MAR instruction captures position data within a 3 µs uncertainty. The position is directly input to the axis\_servo\_drive.Registration\_Position register in Logix software.

Figure 35 - Logix Position Register Entry

| K7k_axis.Registration1Position | 0.0 | Float | REAL |
|--------------------------------|-----|-------|------|
| K7k_axis.Registration2Position | 0.0 | Float | REAL |

Power for the inputs is supplied by an internally supplied 24V DC supply.

See <u>Table 20</u> - <u>Digital Input Descriptions</u> and <u>Table 21</u> - <u>Digital Input</u> <u>Specifications</u> starting on page <u>52</u> for On/Off signal voltages and current levels.

Registration functions and faults actions are programmed through RSLogix software. Kinetix 7000 firmware provides an additional 50 ms of debounce.

**ATTENTION:** Overvoltage protection is not provided for the Registration input signal.

It is recommended to use the on drive power to power Registration. If an external power source is used, you must take responsibility to be sure that the voltage/current does not exceed the rating of the input.

The schematic below depicts the Registration circuits. It is provided as a reference only.

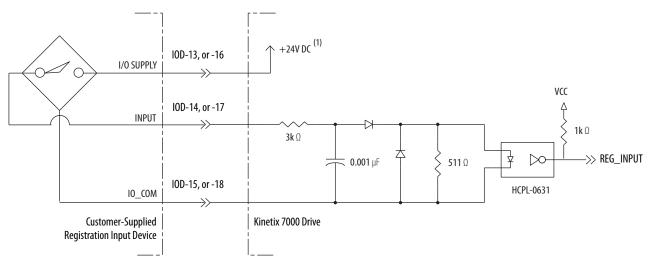

Figure 36 - Registration Digital Input Circuit Diagram

(1) +24V DC source (range) = 21.6V . . . 26.4V (supplied by the drive, not to exceed 300 mA total). Maximum current input = 10 mA.

## **Analog Inputs (IOD Connector)**

#### **IMPORTANT**

RSLogix 5000® software, version 15, does not support analog input utilization.

Two analog inputs are provided, with 14-bit resolution (13 data bits, plus sign). The analog data streamed to RSLogix™ by these inputs is useful for managing dynamic machine operations, for example tension transducers in an outer tension control loop.

The input range of these inputs is  $\pm 10V$ , and overvoltage protection is  $\pm 12V$ . Inputs are updated at the drive every 125  $\mu s$ . Frequency response of the input is up to 4 kHz, and input impedance is 12 k $\Omega$ .

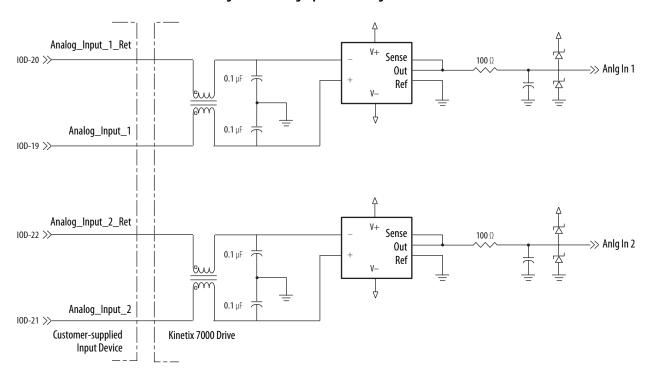

Analog inputs are available as a real-time attribute and Get System Value (GSV) within RSLogix software.

**ATTENTION:** Gain and offset attributes are not provided for the Analog Inputs input signals, and no drive faults are issued.

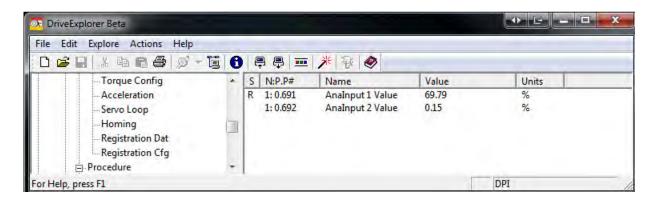

The schematic below depicts the Analog Input circuits. It is provided as a reference only.

Figure 37 - Analog Input Circuit Diagram

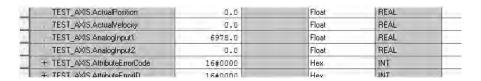

#### Reading Analog Input Voltage Values

When connecting to the Kinetix 7000 drive via DriveExecutive™ or DriveExplorer™, the input voltage is displayed as a percentage in parameters 691 [AnaInput 1 Value] and 692 [AnaInput 2 Value].

In the example above, analog input 1 displays 69.79%. This value equals 100% of  $\pm 10$ V DC. Therefore the actual value of analog input 1 is 6.98V DC.

When viewed in RSLogix 5000 using a real-time attribute on the Drive/Motor tab on the Module Properties dialog, the corresponding bit value displays as in the example below.

Divide the value displayed by 100 to determine the actual voltage on the input. 6978 / 100 = 69.78% or 6.98V DC.

## **Analog Outputs (IOD Connector)**

The two analog outputs (Analog\_Out\_1 and Analog\_Out\_2) are strictly for troubleshooting and cannot be used to drive other loads.

The analog outputs provide 12-bit resolution (11 data bits, plus sign) of the gain and filtering parameters within RSLogix software. In this way a data stream can be displayed by a meter or scale as velocity, torque, or following error information.

The  $\pm 10V$  outputs provide positive and negative direction range, with a null setting of 0V. For example,  $\pm 10V$  range, with 0V = 0. The drive update rate for these outputs is  $125~\mu s$ , and is current limited to 25~mA.

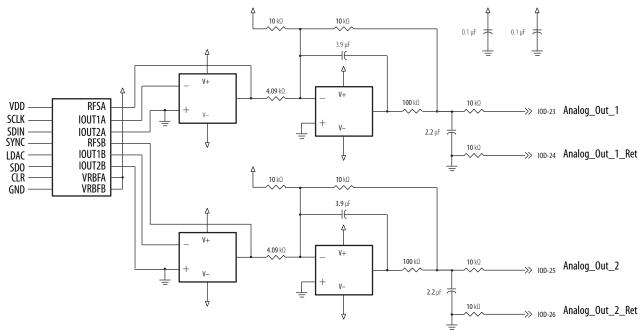

Analog output functions are programmed in RSLogix software using a message instruction. The default pin assignments and the default gain values for the velocity, torque, and following error parameters are listed below.

| Signal       | Default Pin | Parameter | Gain Value | Analog Output    |
|--------------|-------------|-----------|------------|------------------|
| Analog_Out_1 | IOD-23      | Velocity  | 0.0060     | 1V = 1000 rpm    |
| Analog_Out_2 | IOD-25      | Torque    | 0.1        | 1V = 100% torque |

A single pole low pass digital filter is provided for each analog output. The digital filter frequency range is 1...4 kHz.

The schematic depicts the Analog Output circuits. It is provided as a reference only.

Figure 38 - Analog Outputs Circuit Diagram

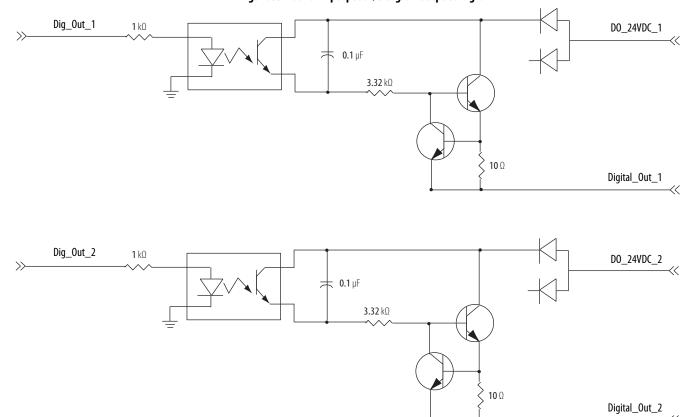

## **General-purpose I/O (GPIO Connector)**

Two 24V digital outputs are user programmable. You can monitor the status the an optional regenerative power supply. An isolated, external 24V DC power source must be customer supplied to power the digital outputs.

| Pin | Signal        | Description   | On Condition | Off Condition Leakage |
|-----|---------------|---|--------------|-----------------------|
| 1   | Digital_Out_1 | Optically isolated to 500V, current sourcing up to 75 mA  | 2440V DC     | <0.25 mA              |
| 2   | DO_24VDC_1    | 24V DC power source to digital inputs (customer-supplied) | _            | _                     |
| 3   | D0_24VDC_2    |   |              |                       |
| 4   | Digital_Out_2 | Optically isolated to 500V, current sourcing up to 75 mA  | 2440V DC     | <0.25 mA              |
| 5   | Reserved      | •   | <u>.</u>     |                       |
| 6   |               |   |              |                       |

The two DC current sourcing outputs default settings are Zero\_Speed (Digital\_Out\_1) and In\_Position (Digital\_Out\_2). Zero\_Speed is the motor at 0 rpm velocity. In\_Position can be set to the commanded position by the Position Lock Tolerance (set in Axis Properties/Limits). Default parameter selections can also be set with an IDN function.

Figure 39 - General-purpose I/O Digital Output Diagram

The regenerative power supply OK provides status on the regenerative converter; in doing so, provides status to the Kinetix 7000 drive that there is DC bus power. Selecting the 8720MC-RPSxxx on the Power tab in the Kinetix 7000 drive I/O configuration in RSLogix requires the customer to provide a 24V DC power source to GPIO pins 7 and 8 as shown in Table 23 and in the interconnect diagrams in Appendix B. A failure to do so will cause a Regen\_PS\_OK (E111) fault, which indicates that he Regen\_OK signal is missing at pins 7 and 8 of the GPIO connector. Kinetix 7000 drive firmware provides an additional 50 ms debounce.

Table 23 - General-purpose I/O Regenerative Power Supply OK Specifications

| Pin | Signal    | Description  | On Condition           | Off Condition                          |
|-----|-----------|--|------------------------|--|
| 7   | Regen_OK+ | Optically isolated (500V), single-ended active high signal | 1238V DC @<br>3.312 mA | less than 6.6V DC, less<br>than 1.5 mA |
| 8   | Regen_OK- |  | 3.3 IZ IIIA            | tiidii 1.5 iiiA                        |

Figure 40 - General-purpose I/O Regenerative Power Supply OK Diagram

## **General-purpose Relay (GPR Connector)**

Two general-purpose relay connections are accessed through the GPR connector. GPR1+ is a normally open, dry relay contact, supporting 2 A at 30V DC  $\pm 10\%$  with suppression. This relay defaults to Motor Brake control, and specifically provides suppression. GPR2+ is a normally open, dry relay contact, supporting 2 A at 250V AC or 2 A at 30V DC without suppression. This relay defaults to Drive OK. An external 24V DC power source must be supplied.

The following are default values for the general-purpose relays.

Table 24 - General-purpose Relay Outputs Descriptions

| Output: | Default Relay Setting in<br>RSLogix Software | Description  |
|---------|--|--|
| GPR1+   | Motor Brake                                  | Turn-on and turn-off delays are specified by the Brake<br>Engage Delay Time and Brake Release Delay Time in<br>RSLogix software. |
| GPR2+   | Drive OK (DROK)                              |  |

### **Sercos Connections**

Two fiber-optic connectors (transmit and receive) are provided on the Kinetix 7000 drive.

**Table 25 - Sercos Communication Specifications** 

| Specification  | Description       |
|----------------|-------------------|
| Data Rates     | 4 Mbps and 8 Mbps |
| Node Addresses | 0199 (1)          |

<sup>(1)</sup> Node addresses for additional axes on the same system are assigned by sequentially incrementing each additional axis. See Node Addressing Examples on page 108 for more information.

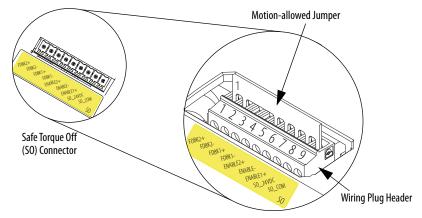

## Safe Torque Off (SO Connector)

Kinetix 7000 drives provide safety functions and system integrity.

The Kinetix 7000 drive ships with a (9-pin) wiring-plug header having a motionallowed jumper installed in the Safe Torque Off (SO) connector. With the motion-allowed jumper installed, the Safe Torque Off feature is disabled.

For Safe Torque Off wiring information, see the Kinetix Safe Torque Off Feature Safety Reference Manual, publication <u>GMC-RM002</u>.

Figure 41 - Safe Torque Off, Motion-allowed Jumper

## **Control Power Specifications**

The following table provides specifications for the Control Power (CP) connector.

| Attribute                  | Value                            |
|----------------------------|----------------------------------|
| Auxiliary DC input voltage | 24V DC, 3 A max, range 1830 V DC |

# Motor (MF) and Auxiliary Feedback (AF) Connections

The motor interface and auxiliary feedback interfaces are consistent across the Kinetix product line. This section provides information on motor and auxiliary feedback connections.

The Kinetix 7000 motor (MF) and auxiliary (AF) feedback ports can accept the following encoder types:

- SRM/SRS Stegmann Hiperface encoders
- 5V TTL differential line driver with index pulse and hall commutation
- Sin/Cos differential input with index pulse and hall commutation

Motor feedback requires the RSLogix 5000 motion.db file to properly commutate the motor. Motors available in RSLogix software include feedback types that are designated as S and M in Allen-Bradley catalog numbers. Following are further definitions of these feedback types.

- S type single-turn 1024 cycles per rotation (interpolated to over 2 million counts in the drive) For example, the MPL-B980D-SJ72AA has this feedback type.
- M type multi-turn 1024 cycles per rotation (interpolated to over 2 million counts in the drive). For example, the MPL-980D-MJ72AA has this feedback type. The "M" type allows for 4096 cycles absolute retention when the encoder is powered down.

Kinetix RDB or MMA motor feedback from EnDat absolute encoders is also accepted, but only when using drive firmware revision 1.104 or higher and the 2090-K7CK-KENDAT low-profile feedback module.

Third-party motor requests must be pre-qualified and a custom motor file developed. Contact your local distributor or Rockwell Automation Sale Representative for more information.

Kinetix 7000 drives cannot drive open loop (no feedback) or other motor types that are not defined in the Kinetix motor database.

## **Motor and Auxiliary Feedback Specifications**

AM, BM, and IM input encoder signals are filtered using analog and digital filtering. The inputs also include illegal state change detection. <u>Figure 42</u> is a schematic of the AM, BM, and IM inputs.

The state of the s

Figure 42 - AM, BM, and IM Motor Encoder Inputs

**Table 26 - Motor Encoder Feedback Specifications** 

| Attribute               | Value   |  |
|-------------------------|---|--|
| Encoder Types           | Incremental, A quad B, Sine/Cosine, Intelligent, and Absolute |  |
| Maximum Input Frequency | 5.0 MHz (TTL input) per channel                               |  |
|                         | 250 kHz (Sine/Cosine input)                                   |  |
| Commutation Feedback    | Hall sensor   |  |

<u>Table 27</u> provides a description of the AM, BM, and IM inputs for TTL encoders.

**Table 27 - TTL Encoder Specifications** 

| Parameter  | Description  | Minimum | Maximum |
|--|--|---------|---------|
| AM, BM, and IM<br>ON-state<br>Input Voltage  | Input voltage difference between the + input and the - input that is detected as an ON-state.  | +1.0V   | +7.0V   |
| AM, BM, and IM<br>OFF-state<br>Input Voltage   | Input voltage difference between the + input and the - input that is detected as an OFF-state. | -1.0V   | -7.0V   |
| Common Mode<br>Input Voltage   | Potential difference between any encoder signal and logic ground.                              | -7.0V   | +12.0V  |
| DC Current Draw  | Current draw into the + or - input.  | -30 mA  | 30 mA   |
| AM, BM Input Signal Frequency Frequency of the AM or BM signal inputs. The count frequency is 4 times this frequency, since the circuitry counts all four transitions. |  | _       | 5.0 MHz |

| Parameter Description   |   | Minimum | Maximum |
|---|---|---------|---------|
| M Pulse Width  Pulse width of the index input signal. Since the index is active for a percentage of a revolution, the speed determines the pulse width. |   | 125 nS  | _       |
| AM, BM Phase Error<br>2.5 MHz Line<br>Frequency   | Amount that the phase relationship between the AM and BM inputs can deviate from the nominal 90°. | -22.5°  | +22.5°  |
| AM, BM Phase Error<br>1 MHz Line<br>Frequency   | Amount that the phase relationship between the AM and BM inputs can deviate from the nominal 90°. | -45°    | +45°    |

The table provides a description of the AM and BM inputs for Sine/Cosine encoders.

Table 28 - AM, BM, and IM Input Specifications for Sine/Cosine Encoders

| Parameter Description                    |   | Minimum    | Maximum    |
|--|---|------------|------------|
| Sine/cosine<br>Input Signal<br>Frequency | Frequency of the Sine or Cosine signal inputs.            |            | 250 kHz    |
| Sine/cosine<br>Input Voltage             | Peak-to-peak input voltages of the Sine or Cosine inputs. | 0.5V (p-p) | 2.0V (p-p) |

**Table 29 - Specifications for EnDat Encoders** 

| Command Set       | Order<br>Designation | Description                              |  |
|-------------------|----------------------|--|--|
| EnDat Sine/Cosine | EnDat 01             | 1V (p-p) Sin/Cos, <2 MHz clock frequency |  |

#### Auxiliary Feedback (AF)

These requirements apply to the Auxiliary Feedback signals.

- For TTL devices, the position count increases when A leads B.
- For sinusoidal devices, the position count increases when cosine leads sine.
- $\bullet~$  TTL devices must be 5V devices within the input voltage specification.
- Use the Low Profile Connector Kit, catalog number 2090-K6CK-D15F to access the Auxiliary Feedback signals. You must supply cabling that has shielding, and other EMI protection for motor feedback cables.

#### Feedback Power Supply

The power circuit board generates the +5V and +9V DC for the motor and auxiliary feedback power supplies. Short-circuit protection and separate common mode filtering for each channel is included.

- Kinetix MPL-Bxxxx, MPM-Bxxxxx, Kinetix HPK-B/Exxxxx, and MMA-Bxxxxxx motors all use 9V power sources from the Motor Feedback (MF) connector. See Kinetix MMA Asynchronous Motor Frequently Asked Questions for Good Installation Processes, Knowledgebase article for additional information.
- Compatible Auxiliary Feedback devices include Stegmann Hiperface, Sine/Cosine, and 5V TTL encoder types. Note: EnDat sine/cosine encoders are only compatible when using the 2090-K7CK-KENDAT feedback module, however an interface module does not exist for the auxiliary encoder input.
- See the Kinetix 7000 Design Guide, publication <u>KNX-RM007</u>, for cables compatible with the Kinetix 7000 drive and motor.
- Low profile connector lets you develop a custom cable for the Motor Feedback (MF) or Auxiliary Feedback (AF) connectors.

The following table details power supply specifications for the motor and auxiliary feedback connectors.

Table 30 - Motor and Auxiliary Feedback Power Supply Specifications

| Power  | Signal Name | Voltage (V DC) |     |      | Current (mA) |                        |
|--------|-------------|----------------|-----|------|--------------|------------------------|
| Supply |             | Min            | Nom | Max  | Min          | Max                    |
| +5V    | EPWR_5V     | 4.95           | 5.4 | 5.67 | 10           | 400 (1) (3)            |
| +9V    | EPWR_9V     | 8.3            | 9.1 | 9.9  | 10           | 275 <sup>(2) (3)</sup> |

<sup>(1) 400</sup> mA on the 5V supply split in any manner between the channels with no load on the 5V supply.

<sup>(2) 275</sup> mA on the 9V supply split in any manner between the channels with no load on the 9V supply.

<sup>(3) 300</sup> mA on the 5V supply on one channel with 150 mA on the 9V supply on the second channel.

Notes:

## **Connect the Kinetix 7000 Drive System**

This chapter provides procedures for wiring your Kinetix 7000 drive system components and making cable connections.

## **Basic Wiring Requirements**

This section contains basic wiring information for the Kinetix 7000 drive.

**ATTENTION:** Plan the installation of your system so that you can perform all cutting, drilling, tapping, and welding with the system removed from the enclosure. Because the system is of the open type construction, be careful to keep any metal debris from falling into it. Metal debris or other foreign matter can become lodged in the circuitry, that can result in damage to components.

**SHOCK HAZARD:** To avoid hazard of electrical shock, perform all mounting and wiring prior to applying power. Once power is applied, connector terminals may have voltage present even when not in use.

#### **IMPORTANT**

This section contains common PWM servo system wiring configurations, size, and practices that can be used in a majority of applications. National Electrical Code, local electrical codes, special operating temperatures, duty cycles, or system configurations take precedence over the values and methods provided.

## **Building Your Own Motor Cables**

# **IMPORTANT** Factory-made cables are designed to minimize EMI and are recommended over hand-built cables to optimize system performance.

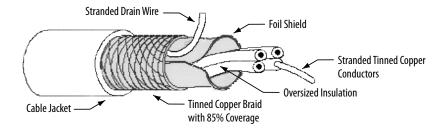

- Connect the cable shield to the connector shells on both ends of the cable
  with a complete 360° connection. If separate power wires are used in a
  customer-supplied power cable, the shield may alternatively be connected
  to a ground terminal.
- Use a twisted pair cable whenever possible. Twist differential signals with each other and twist single-ended signals with the appropriate ground return.
- Discrete power cables require 360° shielding. Connect the shield to a ground terminal.

See the Kinetix® Motion Control Selection Guide, publication KNX-SG001, for low-profile connector kit, drive-end (mating) connector kit, and motor-end connector kit catalog numbers.

#### **Shielded Motor Cable**

The use of a four-wire type Variable Frequency Drive (VFD), 600 volt, UL listed cable is strongly recommended for all motor currents at or below 130 Amperes. The illustration below illustrates the type of cable required.

Figure 43 - Type of Cable Required for Kinetix 7000 Drive Interconnects

## Required Cable Types

You should always use shielded motor cable. The shield must connect to the drive chassis (PE) connection and the motor frame. Make the connection at both ends to minimize the external magnetic field. If you use cable trays or large conduits to distribute the motor leads for multiple drives, use shielded cable to reduce noise from the motor leads.

### **Cable Sizes**

In the table below the appropriate VFD shielded cable to use based on 150% overload capability and 25  $^{\circ}$ C (77  $^{\circ}$ F) operating temperature is shown.

For applications above 130 Amps, use thick insulation lead wire, such as RHW-2 or equal. Make sure you thread the four wires (U, V, W, and ground) through a single, grounded, metal conduit.

Table 31 - 1.5x Rated Continuous Motor Current Cable Size

| Motor Current | Cable Size      |     |  |
|---------------|-----------------|-----|--|
|               | mm <sup>2</sup> | AWG |  |
| 12 A          | 1.5             | 16  |  |
| 17 A          | 2.5             | 14  |  |
| 21 A          | 4               | 12  |  |
| 30 A          | 6               | 10  |  |

| 95 A          | 25              | 4   |  |
| 130 A         | 35              | 2   |  |

#### **Conduit**

For applications above 130 Amperes, metal conduit is required for cable distribution. Follow these guidelines:

- Drives are normally mounted in cabinets, and ground connections are
  made at a common ground point in the cabinet. If the conduit is
  connected to the motor junction box and the drive end is connected to the
  ground panel in the cabinet, you do not need any additional conduit
  connections.
- Route no more than three sets of motor leads and a ground wire through a single conduit. This minimizes cross talk that also reduces the effectiveness of the noise reduction methods described. If more than three drive/motor connections per conduit are required, use shielded cable. If practical, each conduit should contain only one set of motor leads.
- You should use a thick insulation lead wire, such as type RHW-2 or equal.

### **General Wire Guidelines**

Observe all applicable safety and national and local regulations when selecting the appropriate wire size for your system. Due to the drive overload capacity of 150% of the continuous current rating, the conductors for the transformer primary and secondary must be sized (at a minimum) for 125...160% of the maximum continuous input current for the motor selected. The motor conductors must also be rated for a minimum of 125...160% of the full load motor continuous current. If less than 150% overload is required the torque limit parameters must be set in the drive accordingly. The distance between the drive and motor may affect the size of the conductors used. To protect against interference, use shielded wire in motor and control circuits. A shielded cable is required for all feedback signal wires.

**ATTENTION:** To avoid a possible shock hazard caused by induced voltages, ground unused wires in the conduit at both ends.

For the same reason, if a drive sharing a conduit is being serviced or installed, disable all drives using this conduit. This removes the possible shock hazard from cross-coupled drive motor leads.

## **Routing the Power and Signal Cables**

Be aware that when you route power and signal wiring on a machine or system, radiated noise from nearby relays, transformers, and other electronic drives can be induced into motor or encoder feedback signals, input/output communication, or other sensitive low voltage signals. This can cause system faults and communication problems.

See Minimizing Electrical Noise on page 26 for examples of routing high and low voltage cables in wireways, and to the System Design for Control of Electrical Noise Reference Manual, publication GMC-RM001, for more information.

## Determine the Input Power Configuration

Before wiring input power to your Kinetix 7000 drive system, you must determine the type of input power within your facility. The drive is designed to operate in both grounded and ungrounded environments.

**ATTENTION:** When you are using a LIM module with your Kinetix 7000 drive, the AC line input power must come from a grounded power configuration.

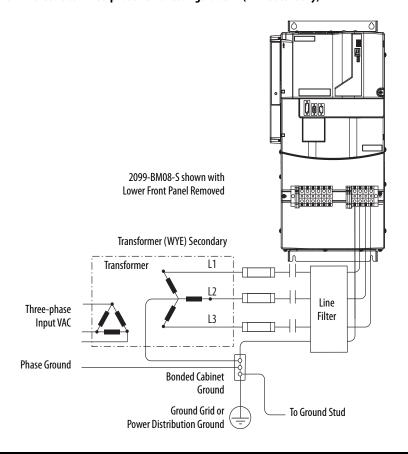

When you are not using a LIM module with your Kinetix 7000 drive, ungrounded, corner-grounded, and impedance-grounded input power configurations are permitted, but you must set the ground jumper as indicated in <u>Table 33</u>. In addition, set the ground jumper when an active converter supplies the DC-bus voltage.

See <u>Set the Ground Jumper in Select Power Configurations</u> on <u>page 77</u> for additional information.

### **Grounded Power Configurations**

The grounded (WYE) power configuration lets you ground your three-phase power at a neutral point. This type of grounded power configuration is preferred.

Figure 44 - Grounded Three-phase Power Configuration - (WYE Secondary)

**IMPORTANT** 

If you determine that you have grounded power distribution in your facility, you do not need to set the ground jumper.

 $\Diamond$ į 2099-BM08-S Shown with Lower Front Panel Removed Transformer (Delta) Secondary Transformer Line Filter L3 **Bonded Cabinet** Ground To Ground Stud Ground Grid or Power Distribution Ground

2099-BM08-S shown with **Lower Front Panel Removed** Transformer (WYE) Secondary L1 Transformer Line L2 Filter Three-phase L3 Input VAC Phase Ground **Bonded Cabinet** Ground To Ground Stud Ground Grid or **Power Distribution Ground** 

Figure 46 - Impedance-grounded Power Configuration (WYE Secondary)

#### **IMPORTANT**

Even though impedance-grounded and corner-grounded power configurations have a ground connection, treat them as ungrounded when installing Kinetix 7000 drives.

See <u>Interconnect Diagrams</u> beginning on page <u>161</u> for input power interconnect diagrams.

### **Ungrounded Power Configurations**

Kinetix 7000 drives contain protective MOV devices and common-mode capacitors that are referenced to ground. Disconnect the protective MOV devices and capacitors if the drive has an ungrounded, impedance-grounded, or cornergrounded power configuration where the line-to-ground voltages on any phase exceeds 125% of the nominal line-to-voltage.

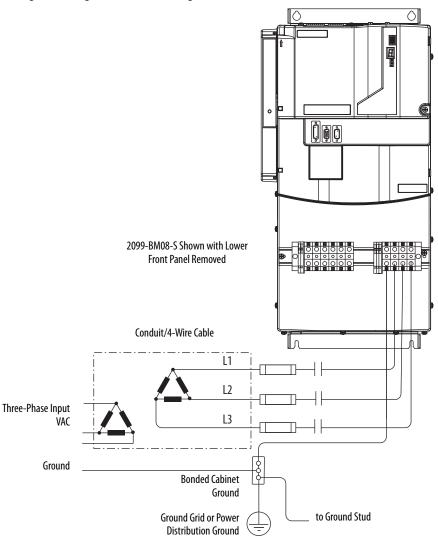

**ATTENTION:** To avoid unstable operation and/or drive damage, these devices must be disconnected if the drive has an ungrounded, impedance-grounded, or corner-grounded power configuration.

Ungrounded systems do not reference each phase potential to a power distribution ground. This can result in an unknown potential to earth ground.

A Kinetix 7000 drive application using an active converter for DC-bus voltage is considered an ungrounded power distribution system.

Figure 47 - Ungrounded Power Wiring

## Set the Ground Jumper in Select Power Configurations

Setting the ground jumper is necessary when using an ungrounded, corner-grounded, and impedance-grounded power configuration. Also, set the ground jumper when you are using the 8720MC regenerative power supply, or any active converter, for DC-bus voltage. Setting the ground jumper involves accessing the power chassis and removing jumper plugs or disconnecting wires on the power terminals.

**ATTENTION:** To avoid personal injury, the ground jumper access area must be kept closed when power is applied. If power was present and then removed, wait at least 5 minutes for the DC-bus voltage to dissipate and verify that no DC-bus voltage exists before accessing the ground jumper.

Because the unit no longer maintains line-to-neutral voltage protection, risk of equipment damage exists when you remove the ground jumper.

**Table 32 - Ground Jumper Configurations** 

| Ground Configuration  | Example Diagram  | Ground Jumper Configuration | Benefits of Correct Configuration  |
|---|--|-----------------------------|--|
| Grounded (wye)  | Figure 44 on page 73   | Installed (default setting) | UL and EMC compliance Reduced electrical noise Most stable operation Reduced voltage stress on components and motor bearings |
| <ul> <li>Corner grounded</li> <li>Impedance grounded</li> <li>AC-fed ungrounded</li> </ul> DC-bus from active converter | Figure 45 on page 74 Figure 46 on page 75 Figure 47 on page 76 Figure 75 on page 165 | Removed                     | Helps avoid severe equipment damage<br>when ground faults occurs     Reduced leakage current                                 |

Table 33 - Jumper/Wire Location and Removal Instructions

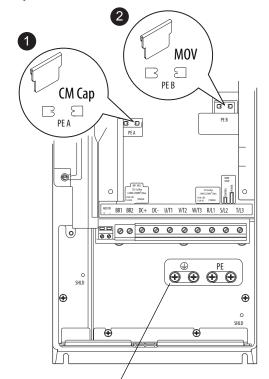

| Drive                                       | Jumper/Wire          | ID No. | Component             | Location   |

|   |                      | 6      | MOVs                  | Ground Wires on 2099-BM11-S and 2099-BM12-S Drives on page 79.   |

## Remove the Ground Jumper on 2099-BM06-S, 2099-BM07-S, and 2099-BM08-S Drives

Figure 48 shows the location of the jumpers in 2099-BM06-S, 2099-BM07-S, and 2099-BM08-S drives on the power chassis. The common mode capacitor jumper is indicated by callout 1 (PEA) and the MOV jumper is indicated by callout 2 (PEB).

Remove each jumper by carefully pulling it straight out.

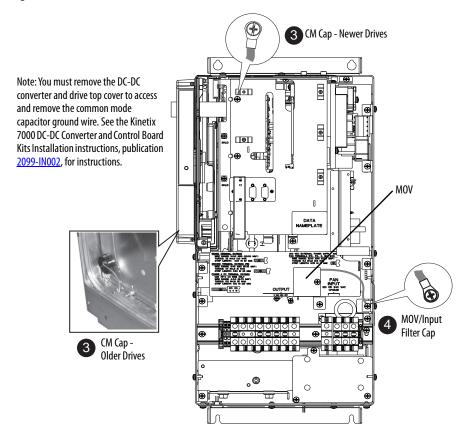

Figure 48 - Ground Jumper Location on 2099-BM06-S, 2099-BM07-S, and 2099-BM08-S

#### Remove the Ground Wires on 2099-BM09-S and 2099-BM10-S Drives

Figure 49 shows the locations of the common mode capacitor and MOV/input filter capacitor ground wires in 2099-BM09-S and 2099-BM10-S drives. The common mode capacitor ground wire is indicated by callout 3 and the MOV/input filter cap ground wire is indicated by callout 4.

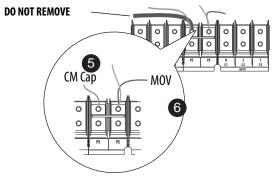

Figure 49 - Ground Wire Locations on Terminal Block of 2099-BM09-S and 2099-BM10-S

### Remove the Ground Wires on 2099-BM11-S and 2099-BM12-S Drives

Figure 50 shows the locations of the common mode capacitor and MOV ground wires in 2099-BM11-S and 2099-BM12-S drives. The common mode capacitor ground wire is indicated by callout 5 and the MOV ground wire is indicated by callout 6.

Figure 50 - Ground Wire Location on Power Terminal Block of 2099-BM11-S and 2099-BM12-S

## Grounding the Kinetix 7000 Drive System

All equipment and components of a machine or process system must have a common earth ground point connected to their chassis.

A grounded system provides a ground path for short-circuit protection. Grounding your modules and panels minimize shock hazard to personnel and damage to equipment caused by short-circuits, transient overvoltages, and accidental connection of energized conductors to the equipment chassis.

See Agency Compliance on page 16 for CE and UK grounding requirements.

**IMPORTANT** 

To improve the bond between the drive and subpanel, construct your subpanel out of zinc-plated (paint-free) steel.

## **Grounding Your System to the Subpanel**

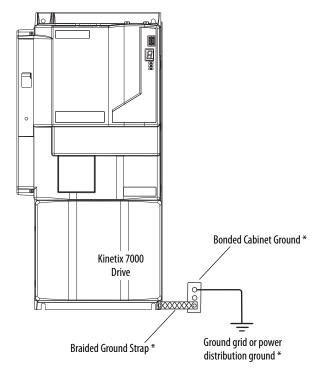

In <u>Figure 51</u>, the drive is shown properly grounded to the bonded cabinet ground on the subpanel.

**ATTENTION:** The National Electrical Code contains grounding requirements, conventions, and definitions. Follow all applicable local codes and regulations to safely ground your system.

See the Interconnect Diagram Notes diagrams beginning on page 162.

Figure 51 - Drive Chassis Ground Connection

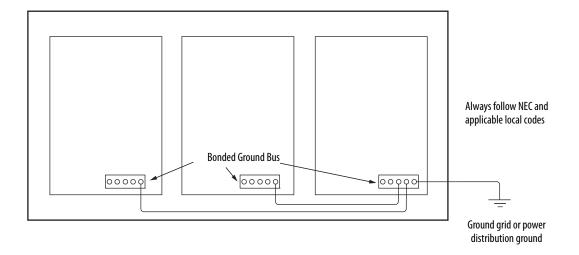

<sup>\*</sup> Indicates customer-supplied item.

### **Grounding Multiple Subpanels**

To extend the chassis ground to multiple subpanels, see Figure 52.

**IMPORTANT** HF bonding is not illustrated. For HF bonding information, see Bonding Multiple Subpanels on page 28.

Figure 52 - Subpanels Connected to a Single Ground Point

#### **Motor Power Cable Shield Termination**

Factory-supplied motor power cables for Kinetix MP motors are shielded, and the braided cable shield must terminate at the drive when installed. A small portion of the cable jacket must be removed to expose the shield braid. The exposed area must be clamped (using the clamp provided on the 2099-BM06-S, -BM07-S, and -BM08-S drives) to the drive to provide a 360° termination. Factory-supplied power cables must also be terminated in the motor power (MP) connector plug.

**ATTENTION:** To avoid hazard of electrical shock, be sure the shielded power cables are grounded at a minimum of one point for safety.

Customer-supplied power cables must be shielded, and the braided cable shield or conduit must terminate at the drive when installed. An area of the power cable shield must be exposed and terminated for 360° at the drive. In a similar manner, conduit enclosing discrete power cables must be terminated for 360° at the drive.

Drive Conduit or Cable Braid Clamped at Drive Frame Provides 360° Shield Termination. Clamp Also Connects to the Nearest Available Bonded Cabinet Ground. **Enclosure** Junction Box Beneath Drive (2099-BM10-S, Wire Restraint 2099-BM11-S, and **Enclosure Clamp Terminates** 2099-BM12-S Only) 360° Shield at Enclosure (1)(2) Conduit in Contact with Clamp 000 Cable Shield Under Clamp Cable with Braided Shield Metallic Conduit with Wires Three-phase Power with For examples of shield clamp attachment, see the System Design for Control of Electrical Noise Reference Manual, publication Ground

Figure 53 - Power Cable Shielding Techniques Recommended for Kinetix 7000 Drives

- GMC-RM001
- If enclosure is painted, remove paint to provide metal-to-metal contact.

#### **Kinetix MPL Motor Connectors**

Kinetix MPL motors equipped with circular DIN connectors (specified by 7 in the catalog number) are not compatible with cables designed for motors equipped with bayonet connectors (specified by 2 in the catalog number). The motors with bayonet connectors are being discontinued.

Bayonet connectors can be mounted facing the motor shaft or end plate and provide a separate connector for power, feedback, and brake connections. Circular DIN connectors rotate up to 180° and combine power and brake wires in the same connector, eliminating the brake connector.

Circular DIN Connectors **Bayonet Connectors Bayonet Connectors** with Brake without Brake Feedback / Power / Brake Feedback / Power **Motor Connectors Motor Connectors Power and Brake** Feedback Motor Motor Connector Connector

Figure 54 - Bayonet and Circular DIN Motor Connectors

**Table 34 - Motor Power Cable Compatibility** 

| Motor/Actuator | Connector    | Motor/Actuator Cat. No.   | Motor Power Cables (with brake wires)  | Motor Power Cables<br>(without brake wires)  |
|----------------|--------------|---|--|--|
| Kinetix MPL    | Circular DIN | MPL-B5xxx, MPL-B6xxx, MPL-B8xxx, and MPL-B9xxx  | 2090-CPBMxDF-xxAAxx or<br>2090-XXNPMF-xxSxx<br>(standard, non-flex)<br>2090-CPBMxDF-xxAFxx <sup>(1)</sup><br>(continuous-flex) | 2090-CPWMxDF-xxAAxx<br>(standard, non-flex)<br>2090-CPWMxDF-xxAFxx <sup>(1)</sup><br>(continuous-flex) |
|                | Bayonet      | MPL-A/B5xxx, MPL-B6xxx, and<br>MPL-B8xxx<br>MPL-B960B, MPL-B960C,<br>MPL-B980B, and MPL-B980C | N/A  | 2090-XXxPMP-xxSxx <sup>(2)</sup>   |
|                |              | MPL-B960D and MPL-B980D   |  | 2090-MCNPMP-6Sxx   |
| Kinetix MPM    | Circular DIN | MPM-B165x and MPM-B215x   | 2090-CPBMxDF-xxAAxx or<br>2090-XXNPMF-xxSxx<br>(standard, non-flex)<br>2090-CPBMxDF-xxAFxx <sup>(1)</sup><br>(continuous-flex) | 2090-CPWMxDF-xxAAxx<br>(standard, non-flex)<br>2090-CPWMxDF-xxAFxx <sup>(1)</sup><br>(continuous-flex) |
| Kinetix RDB    | Circular DIN | RDB-Bxxxx   | N/A  | 2090-CPWMxDF-xxAAxx<br>(standard, non-flex)<br>2090-CPWMxDF-xxAFxx <sup>(1)</sup><br>(continuous-flex) |
| Kinetix HPK    | Terminal Box | HPK-B/Exxxxx  | Customer-supplied (3)  |  |
| Kinetix MMA    |              | MMA-Bxxxxxx   |  |  |

<sup>(1)</sup> You must remove the motor-side o-ring when using 2090-CPxM7DF-xxAxxx cables.

Motors may have a separate brake connector or need routing of thermal switch wires. These are often separately shielded and routed in an existing cable.

See Wiring Examples beginning on page <u>162</u> for interconnect diagrams, and the Power Terminal Block (PTB) Connections diagram on page <u>49</u> for the location of the U, V, W, and ground (PE) motor power terminals.

| IMPORTANT | Securing the cable shield in the clamp with a tie wrap is recommended to improve stress relief. |
|-----------|---|
|           |   |

<sup>(2)</sup> For Kinetix MPL motors equipped with bayonet connectors. These cables are available as standard, non-flex (catalog number 2090-XXNPMP-xxSxx) and continuous-flex (catalog number 2090-XXTPMP-xxSxx)

<sup>(3)</sup> See Kinetix MMA Asynchronous Motor Frequently Asked Questions for Good Installation Processes, Knowledgebase article for additional information, "search Knowledgebase" for Kinetix MMA.

## Input Power Wiring Requirements

National codes and standards (NEC, VDE, BSI etc.) and local codes outline provisions for safely installing electrical equipment. Installation must comply with specifications regarding wire types, conductor sizes, branch circuit protection and disconnect devices.

**ATTENTION:** To avoid personal injury and/or equipment damage, make sure installation complies with specifications regarding wire types, conductor sizes, branch circuit protection, and disconnect devices. The National Electrical Code (NEC) and local codes outline provisions for safely installing electrical equipment.

To avoid personal injury and/or equipment damage, make sure motor power connectors are used for connection purposes only. Do not use them to turn the unit on and off.

To avoid personal injury and/or equipment damage, make sure shielded power cables are grounded to prevent potentially high voltages on the shield.

### **Acceptable Cable Types**

Do not use cable with an insulation thickness less than or equal to 15 mils (0.4 mm/0.015 in.). Use copper wire only. Wire gauge requirements and recommendations are based on 75 °C. Do not reduce wire gauge when using higher temperature wire.

As an approximate guide, provide spacing of 0.3 meters (1 foot) for every 10 meters (32.8 feet) of length. In all cases, long parallel runs must be avoided.

#### Shielded/Armored Cable

Shielded cable contains all of the general benefits of multi-conductor cable with the added benefit of a copper braided shield that can contain much of the noise generated by a typical AC drive. Strong consideration for shielded cable should be given in installations with sensitive equipment such as weigh scales, capacitive proximity switches and other devices that may be affected by electrical noise in the distribution system. Applications with large numbers of drives in a similar location, imposed EMC regulations, or a high degree of communication and networking are also good candidates for shielded cable.

Shielded cable may also help reduce shaft voltage and induced bearing currents for some applications. In addition, the increased impedance of shielded cable may help extend the distance that the motor can be located from the drive without the addition of motor protective devices such as terminator networks.

Consideration should be given to the general specifications dictated by the environment of the installation, including temperature, flexibility, moisture characteristics and chemical resistance. In addition, a braided shield should be included and be specified by the cable manufacturer as having coverage of at least 75%. An additional foil shield can greatly improve noise containment.

A good example of recommended cable is Belden/E 295xx (xx determines gauge). This cable has four XLPE insulated conductors with a 100% coverage foil and an 85% coverage copper braided shield (with drain wire) surrounded by a PVC jacket.

Other types of shielded cable are available, but the selection of these types may limit the allowable. Particularly, some of the newer cables twist four conductors of THHN wire and wrap them tightly with a foil shield. This construction increases the cable charging current required and reduces the overall drive performance. Unless specified in the individual distance tables as tested with the drive, these cables are not recommended and their performance against the lead length limits supplied is not known.

The table below describes the recommended shielded cables.

Table 35 - Shielded Cable Ratings and Types

| Location                         | Rating/Type   | Description   |
|----------------------------------|---|---|
| Standard<br>(Option 1)           | 600V, 90 °C (194 °F),<br>XHHW2/RHW-2<br>Anixter B209500-B209507,<br>Belden B29501-B229507,<br>or equivalent | Four tinned copper conductors with XLPE insulation     Copper braid/aluminum foil combination shield and tinned copper drain wire     PVC jacket  |

#### **Contactors**

A contactor or other device that routinely disconnects and reapplies the AC line to the drive to start and stop the motor can cause drive hardware damage. The drive is designed to use control input signals that will start and stop the motor. If an input device is used, operation must not exceed four cycles per minute maximum, or damage will occur to the drive precharge circuit.

The start/stop/enable control circuitry for the drive includes solid state components. If hazards due to accidental contact with moving machinery or unintentional flow of liquid, gas or solids exist, an additional stop circuitry may be required to remove the AC line to the drive. An auxiliary braking method also may be required.

| IMPORTANT | It is recommended that the drive Safe Torque Off function be used to |
|-----------|--|
|           | minimize contactor cycling.  |

### **Power Wire Specifications**

Wire should be copper with 75 °C (167 °F) minimum rating. Phasing of main AC power is arbitrary and earth ground connection is required for safe and proper operation.

For additional information see Power Specifications on page <u>150</u>, and Interconnect Diagram Notes on page <u>162</u> for interconnect diagrams.

**ATTENTION:** This drive contains ESD (Electrostatic Discharge) sensitive parts and assemblies. You are required to follow static control precautions when you install, test, service, or repair this assembly. If you do not follow ESD control procedures, components can be damaged. If you are not familiar with static control procedures.

See publication <u>8000-4.5.2</u>, Guarding Against Electrostatic Damage or any other applicable ESD protection handbook.

**ATTENTION:** To avoid personal injury and/or equipment damage, be sure the installation complies with specifications regarding wire types, conductor sizes, branch circuit protection, and disconnect devices. The National Electrical Code (NEC) and local codes outline provisions for safely installing electrical equipment

To avoid personal injury and/or equipment damage, be sure the motor power connectors are used for connection purposes only. Do not use them to turn the unit on and off.

To avoid personal injury and/or equipment damage, be sure the shielded power cables are grounded to prevent potentially high voltages on the shield.

## **Power Wiring Guidelines**

Use these guidelines when wiring the power connectors on your Kinetix 7000 drive (without a LIM).

| IMPORTANT | To achieve system performance, run wires and cables in the wireways as established in <u>Chapter 1</u> .  |
|-----------|---|
|           |   |
| IMPORTANT | To limit coil switching transients generated by the LINE contactor, use of a surge suppressor is recommended. For an example, see <a href="Appendix B">Appendix B</a> . |

This procedure assumes you have separate power supply/line filter components mounted on your panel and are ready to wire the AC input power to the drive.

1. Prepare the wires for attachment to each connector by removing insulation equal to an acceptable strip length.

The actual strip length will vary based on the wire gauge and terminal size of the Kinetix 7000 drive.

- **2.** Route the wires to your Kinetix 7000 drive.
- 3. Insert the wires into the connector or connect the wires to the terminals.
- **4.** Tighten the terminal screws/nuts to the recommended torque for the specific terminal.
- Pull on each wire to make sure it does not come out of its terminal. If any wires are loose, reinsert/connect and tighten the wire to the recommended torque.

## Wire the Kinetix 7000 Drive Connectors

See Appendix B for all Kinetix 7000 drive interconnect diagrams.

## Wire the Control Power (CP) Connector

Wire the 24V DC control power supply to your Kinetix 7000 drive as described in <u>Table 36</u>. See Control Power (CP) Terminal Block Connections for more information.

**Table 36 - Control Power Connections** 

| Signal   | Terminal | Recommended Wire Size mm <sup>2</sup> (AWG)        | Strip Length<br>mm <sup>2</sup> (in.) | Torque<br>N•m (lb•in) |
|----------|----------|--|---------------------------------------|-----------------------|
| CP_24VDC | 1        | 0.75 (18)  |                                       |                       |
| CP_COM   | 2        | (stranded wire with ferrule) 1.5 (16) (solid wire) | 7.0 (0.275)                           | 0.235 (2.0)           |

### **Wire AC Input Power**

Wire 460V AC input power to your Kinetix 7000 drive as described in <u>Table 37</u>. See Power Terminal Block (PTB) Connections for more information.

**Table 37 - AC Input Power Connections** 

| Kinetix 7000<br>Drive Cat. No.            | Signal                   | Terminal          | Recommended Wire Size mm <sup>2</sup> (AWG) | Torque<br>N•m (lb•in) |
|---|--------------------------|-------------------|---|-----------------------|

## **Wire DC Input Power (Common Bus Configurations Only)**

Wire the DC input power from a leader regenerative power supply (8720MC-RPS) to a Kinetix 7000 drive as described in <u>Table 38</u>. See Power Terminal Block (PTB) Connections on page <u>49</u> for more information.

| IMPORTANT | DC power from the regenerative power supply (8720MC-RPS) is typically routed to a power distribution box. Fusing will be placed before and after |
|-----------|--|
|           | the distribution box, providing protection for both the 8720MC-RPS and Kinetix 7000 drive.   |

**Table 38 - DC Input Power Connections** 

| Kinetix 7000<br>Drive Cat. No.            | Signal Description | Terminal(s) | Recommended Wire Size mm <sup>2</sup> (AWG) | Torque<br>N•m (lb•in) |

## Wire the Safe Torque Off (STO) Connector

Wire the Safe Torque Off connections to your Kinetix 7000 drive as described in <u>Table 39</u>. See Safe Torque Off (STO) Terminal Block Connections for more information.

| IMPORTANT | Terminals 8 and 9 (24V+ and Common) are only used by the motion-<br>allowed jumper. When using the Safe Torque Off feature, the 24V supply<br>must come from an external source. |
|-----------|--|
|           |  |

**Table 39 - Safe Torque Off Connections** 

| Signal   | Terminal | Recommended Wire Size mm <sup>2</sup> (AWG) | Strip Length<br>mm <sup>2</sup> (in.) | Torque<br>N-m (lb-in) |
|----------|----------|---|---------------------------------------|-----------------------|
| FDBK2+   | 1        |   |                                       |                       |
| FDBK2-   | 2        |   |                                       |                       |

| FDBK1-   | 4        | 0.75 (18)                                   |                                       |                       |
| ENABLE2+ | 5        | (stranded wire with ferrule) 1.5 (16)       | 7.0 (0.275)                           | 0.235 (2.0)           |
| ENABLE-  | 6        | (solid wire)                                |                                       |                       |
| ENABLE1+ | 7        |   |                                       |                       |
| SO_24VDC | 8        |   |                                       |                       |
| SO_COM   | 9        |   |                                       |                       |

## Wire the General Purpose Relay (GPR) and General Purpose I/O (GPIO) Connectors

Wire the control and interface signals on the General Purpose Relay (GPR) and General Purpose I/O (GPIO) connectors as described in <u>Table 40</u> and <u>Table 41</u>. See General-purpose I/O (GPIO) Terminal Block Connections on page <u>44</u> and General-purpose Relay (GPR) Terminal Block Connections on page <u>44</u> for more information.

**ATTENTION:** Wiring the DRIVE OK signal on the General Purpose Relay is required. To avoid injury or damage to the drive, wire the DRIVE OK relay into your safety control string.

In common bus configurations, a REGEN connection on the General Purpose Input/ Output connector is also required for the drives. This connection must be wired in series to the safety control string, and also wired from the 8720MC-RPS to the Kinetix 7000 drive to indicate bus voltage is present.

#### **Table 40 - General Purpose Relay Connections**

| Signal    | Terminal | Description                      | Recommended Wire Size mm <sup>2</sup> (AWG)              | Strip Length<br>mm (in.) | Torque Value<br>N·m (lb·in) |
|-----------|----------|----------------------------------|--|--------------------------|-----------------------------|
| DRIVE OK+ | 5        | Programmable N.O. Relay 2 output | 0.75 (18)  |                          |                             |
| DRIVE OK- | 6        | Programmable Relay 2 common      | (stranded wire with ferrule)<br>1.5 (16)<br>(solid wire) | 7.0 (0.275)              | 0.235 (2.0)                 |

#### Table 41 - General Purpose I/O Connections

| Signal    | Terminal | Description                             | Recommended Wire Size mm <sup>2</sup> (AWG)              | Strip Length<br>mm (in.) | Torque Value<br>N•m (lb•in) |
|-----------|----------|---|--|--------------------------|-----------------------------|
| Regen_OK+ | 7        | Regenerative power supply status        | 0.75 (18)  |                          |                             |
| Regen_OK- | 8        | Regenerative power supply status common | (stranded wire with ferrule)<br>1.5 (16)<br>(solid wire) | 7.0 (0.275)              | 0.235 (2.0)                 |

### **Wire Motor Output Power**

Wire motor output power as described in <u>Table 42</u>. See Power Terminal Block (PTB) Connections on page <u>49</u> for more information.

Table 42 - Kinetix HPK, MMA, MPL, and MPM Motor Power Connections

|   | Green/Yellow                                 | Ť                       | 504 (1/012)                                 | 5 (44)                |

### **Wire the Motor Brake**

Wire the motor brake (if applicable) as described in <u>Table 43</u>. See Power Terminal Block (PTB) Connections on page <u>49</u> for more information on the motor power connections.

| IMPORTANT | Use surge suppression when controlling a brake coil. |
|-----------|--|
|           | See <u>Figure 82 on page 172</u> .                   |

**Table 43 - Motor Brake Connections** 

| Motor Brake Terminal (Signal)      |   | Drive Terminal | Recommended Wire Size | Strip Length | Torque Value |
|------------------------------------|---|----------------|-----------------------|--------------|--------------|
| Kinetix MPL<br>w/Bayonet Connector | Kinetix MP <i>x</i><br>w/Circular DIN Connector | ─ (Signal)     | mm² (AWG)             | mm (in.)     | N·m (lb·in)  |
| A (BR+)                            | F (BR+)   | 2 (GPR1+)      | 2.5 (14)              | 10 (0.38)    | 0.50.6       |
| C (BR-)                            | G (BR-)   | 3 (GPR1-)      | 2.3 (17)              | 10 (0.50)    | (4.45.3)     |

Notes: Kinetix HPK motor brake terminations are BR+ and BR-. Kinetix RDB motors do not have a motor brake. Kinetix MMA motor brake configuration and options vary, the standard option is to have no brake.

Motor brake wiring varies slightly, depending on the motor connector type. The table below identifies the brake wire option for your servo motor and the appropriate brake cable or connector kit catalog number required.

**Table 44 - Motor Feedback Cable Compatibility** 

| Motor Series    | Connector<br>Type | Brake Wire Option  | Cable Cat. No.   |
|-----------------|-------------------|--|--|
| Kinetix MPL     | Circular DIN      | The brake terminals are in the motor power connector. Drive to motor power cables must be ordered with the brake option. | 2090-CPBMxDF-xxAAxx <sup>(1)</sup><br>2090-XXNPMF-xxSxx<br>(standard, non-flex)<br>2090-CPBMxDF-xxAFxx <sup>(1)</sup><br>(continuous-flex) |
|                 | Bayonet           | The motor has a separate brake connector and requires a brake power cable.   | 2090-UXxBMP-18Sxx brake cable <sup>(2)</sup>   |
| Kinetix MPM     | Circular DIN      | The brake terminals are in the motor power connector. Drive to motor power cables must be ordered with the brake option. | 2090-CPBMxDF-xxAAxx (1)<br>2090-XXNPMF-xxXxx<br>(standard, non-flex)<br>2090-CPBMxDF-xxAFxx (1)<br>(continuous-flex)                       |
| Kinetix HPK     | Terminal Box      | The motor has a separate brake wiring connection.  | Customer-supplied  |
| Kinetix MMA (3) |                   | Connection.  |  |

<sup>(1)</sup> You must remove the motor-side o-ring when using 2090-CPxM7DF-xxAxxx cables.

## Feedback and I/O Cable Connections

Factory-made cables with premolded connectors are designed to minimize EMI and are recommended over hand-built cables to improve system performance. However, other options are available for building your own feedback and I/O cables. See Kinetix MMA Asynchronous Motor Frequently Asked Questions for Good Installation Processes, Knowledgebase article for additional information.

Table 45 - Motor Feedback Cable Compatibility - Bayonet Connectors

| Motor/Actuator | Connector | Feedback Type    | Feedback Cable   |                                |  |
|----------------|-----------|------------------|------------------|--------------------------------|--|
| MOLOI/ACLUATOI | Туре      |                  | Premolded        | Flying-lead                    |  |
| MPL-Bxxxx-S    | Bayonet   | Absolute encoder | 2090-UXNFBMP-Sxx | 2090-XXxFMP-Sxx <sup>(1)</sup> |  |

<sup>(1)</sup> For Kinetix MPL and 1326AB (M2L/S2L) motors equipped with bayonet connectors. These cables are available as standard, non-flex (catalog number 2090-XXNFMP-5xx) and continuous-flex (catalog number 2090-XXTFMP-5xx).

Table 46 - Motor Feedback Cable Compatibility - Circular DIN

| Motor/Actuator | Connector<br>Type | Feedback Type                 | Feedback Cable   |  |   |  |
|----------------|-------------------|-------------------------------|------------------|--|---|--|
|                |                   |                               | Premolded        | Flying-lead                                  |   |  |
| HPK-B/Exxxxx   | Circular DIN      | Circular DIN Absolute encoder | Absolute encoder | N/A  | 2090-CFBMxDF-CDAFxx<br>(continuous-flex)<br>2090-CFBMxDF-CEAFxx<br>(continuous-flex)<br>2090-CFBMxDF-CEAAxx<br>(standard, non-flex) |  |
| MMA-Bxxxxxx    |                   |                               |                  | 2090-CFBMxDF-CDAFxx<br>(continuous-flex) (1) |   |  |

<sup>(2)</sup> For Kinetix MPL motors equipped with bayonet connectors. These cables are available as standard, non-flex (catalog number 2090–UXNBMP-185xx) and continuous-flex (catalog number 2090–UXTBMP-185xx).

<sup>(3)</sup> See Kinetix MMA Asynchronous Motor Frequently Asked Questions for Good Installation Processes, <u>Knowledgebase</u> article for additional information, "search Knowledgebase" for Kinetix MMA.

(1) For Kinetix MMA-Bxxxxxx, the 2090-CFBMxDF-CEAFxx and 2090-CFBMxDF-CEAAxx feedback cables will support Hiperface only without PT1000.

Table 47 - Motor Feedback Cable Compatibility - SpeedTec DIN Connectors

## Wire Feedback and I/O Connectors

Wire your feedback and I/O cables.

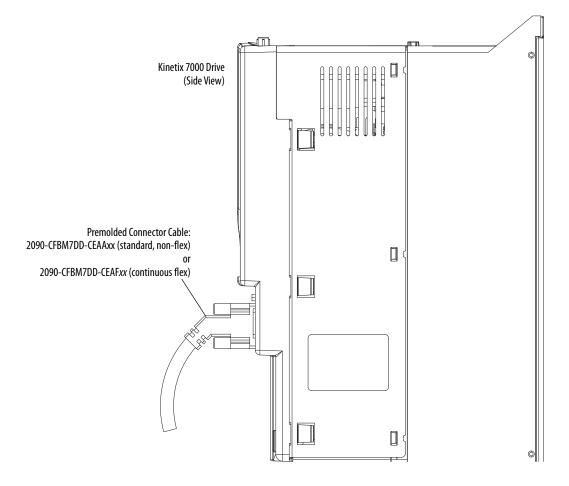

| To make this type of connection | Go to  |
|---------------------------------|--|
| Premolded Cable                 | Connect Premolded Motor Feedback Cables below.             |
| Panel-mounted Breakout Board    | Wire Panel-mounted Breakout Board Kits on page <u>96</u> . |
| Low-profile Connector           | Wire Low-profile Connectors on page <u>97</u> .            |

### **Connect Premolded Motor Feedback Cables**

Motor feedback cables (with premolded connectors) plug directly into 15-pin motor feedback (MF) connectors on Kinetix 7000 drive (no wiring is necessary).

| IMPORTANT | When using Kinetix 2090 cables with premolded connectors, tighten the |  |
|-----------|---|--|
|           | mounting screws (finger tight) to improve system performance.         |  |

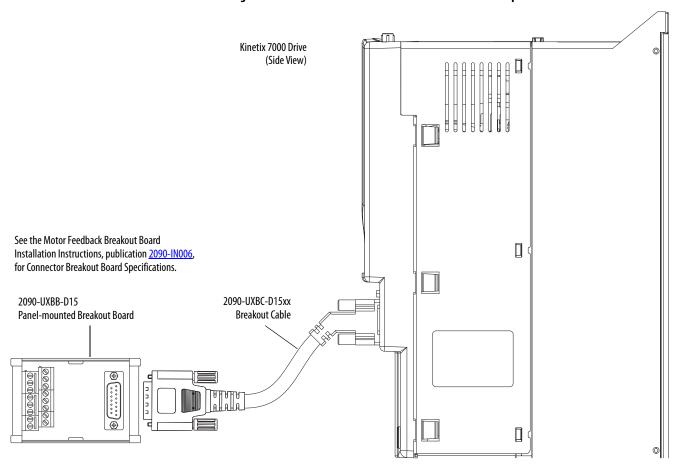

Figure 55 - Premolded Motor Feedback Cable Connection

### **Wire Panel-mounted Breakout Board Kits**

The panel-mounted breakout board kit (catalog number 2090-UXBK-D15xx) includes a (DIN rail) terminal block and cable. The cable connects between the terminal block and the motor feedback (MF) connector. Wires from your flying-lead motor feedback cable connect to the terminals.

Figure 56 - Panel-mounted Breakout Board Connection Example

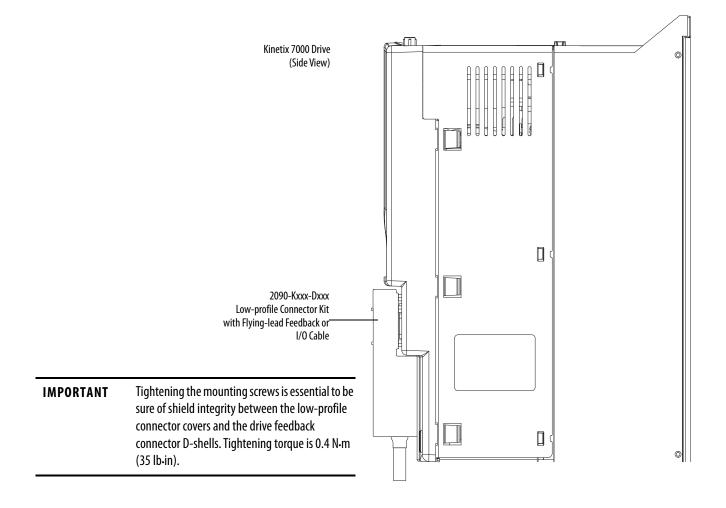

## **Wire Low-profile Connectors**

Low-profile connectors (2090-K6CK-Dxxx) are suitable for motor feedback (MF), auxiliary feedback (AF), and I/O connections (IOD) on Kinetix 7000 drive.

**Table 51 - Low-profile Connector Kits** 

| Connector Kit<br>Cat. No. | Description  | Cable Compatibility   |
|---------------------------|--|---|
| 2090-K7CK-KENDAT          | Low-profile feedback module for connecting to EnDat absolute encoders (15-pin, male, D-sub). Use with any Kinetix 7000 drive and Kinetix RDB motor with EnDat absolute encoder.  NOTE: Only 2099-BMxx-S drives with firmware revision 1.104 or higher support the use of this feedback module. | 2090-XXxFMP-Sxx,<br>2090-XXNFMF-Sxx,<br>2090-CFBMxDF-CDAFxx |
| 2090-K6CK-D15M            | Low-profile connector kit for motor feedback (15-pin, male, D-sub). Use with any Kinetix 7000 drive and compatible motors.   |   |
| 2090-K6CK-D15F            | Low-profile connector kit for auxiliary feedback (15-pin, female, D-sub). Use with any Kinetix 7000 drive for auxiliary feedback applications.   | Customer supplied   |
| 2090-K6CK-D26M            | Low-profile connector kit for I/O (26-pin, male, D-sub). Use with any Kinetix 7000 drive or 2094-BL02 LIM module for making I/O connections.   |   |

Figure 59 - Wiring (26-pin) I/O Cable Connections 2090-K6CK-D26M Connector Kit

#### **IMPORTANT**

The purpose of the cable shield clamp is to provide a proper ground and improve system performance, not stress relief.

Clamping the exposed braid under the shield clamp is critical. Turn the clamp over, if necessary, to be sure of a proper ground.

## External Shunt Module Connections

External active shunt modules listed in the table on page 156 are compatible with Kinetix 7000 drives. Follow these guidelines when wiring your external active shunt module kit.

- Refer to Shunt Resistor on page <u>35</u> for important wiring recommendations.
- Refer to Appendix B for the Kinetix 7000 drive interconnect diagrams.
- Refer to the installation instructions provided with your shunt module.

| IMPORTANT | When tightening screws to secure the wires to the DC bus terminals, see |  |
|-----------|---|--|
|           | Table 38 on page 89 for torque values.                                  |  |

## Sercos Fiber-optic Cable Connections

This procedure assumes you have your Logix Sercos interface module/PCI card and Kinetix 7000 drive mounted and are ready to connect the fiber-optic cables.

The Sercos fiber-optic ring is connected using the Sercos receive (Rx) and transmit (Tx) connectors.

See page <u>63</u> to locate the Sercos connectors on your Kinetix 7000 drive. See the figure below to locate the connectors on your Sercos interface module or PCI card.

Plastic cable is available in lengths up to 32 m (105 ft). Glass cable is available in lengths between 50 m (164 ft) and 200 m (656 ft).

**IMPORTANT** When connecting Kinetix 7000 drives, use at least a 2090-SCEP1-0, 1 m (3 ft) or longer cable. Larger drives may require longer cables.

Figure 60 - CompactLogix, ControlLogix, and SoftLogix Sercos Connector Locations ControlLogix® Platform CompactLogix™ Platform 1768-M04SE Sercos 1756-MxxSE Sercos \_\_\_\_ interface Module interface Module (10) SoftLogix™ Platform 1756-PM16SE Sercos interface PCI Card (as viewed from the back of your personal (Q.(i) RSLogix 5000® Software computer) CP Front View Sercos Transmit Connector, Tx Front View Sercos Receive Connector, Rx  $\bigcirc$ **Bottom View** Sercos Receive Connector, Rx (front) Sercos Transmit Connector, Tx (rear)

100

Kinetix 7000 Drive

Connect the cable from transmit on the Logix module to receive on the Kinetix 7000 drive, then transmit to receive (drive to drive), and from transmit on the last drive back to receive on the Logix module.

**ATTENTION:** To avoid damage to the Sercos Rx and Tx connectors use only finger-tight torque when attaching the fiber-optic cables to the Kinetix 7000 drive. Do not use a wrench or any other mechanical assistance.

For more information, see the Fiber-optic Cable Installation and Handling Instructions, publication <u>2090-IN010</u>.

Kinetix 6000 System

Figure 61 - Fiber-optic Cable Connections to a SoftLogix Module

The following fiber-optic cable examples are shown using ControlLogix modules. CompactLogix modules connect in the same way, however the ring cannot include more than four drives.

Figure 62 - Fiber-optic Cable Connections to ControlLogix/CompactLogix Modules

You can also mount the two Logix Sercos modules in two separate chassis, or you can mount them in the same chassis.

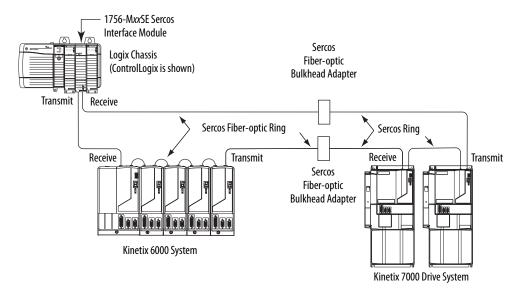

| IMPORTANT | Clean the fiber-optic cable connectors prior to installation. Dust in the connectors can reduce signal strength. |
|-----------|--|
|           | See the Fiber-optic Cable Installation and Handling Instructions, publication 2090-IN010, for more information.  |

The following example depicts the second Kinetix system, consisting of Kinetix 7000 drives, located in a separate cabinet and connected with bulkhead adapters.

**IMPORTANT** 

To avoid signal loss, do not use bulkhead adapters to connect glass cables. Use bulkhead adapters for making plastic-to-plastic cable connections only.

Figure 63 - Fiber-optic Cable Connections (ControlLogix/CompactLogix)

Notes:

# Configure and Start the Kinetix 7000 Drive System

This chapter provides procedures for configuring your Kinetix\* 7000 system components with the Logix Sercos module.

| Торіс   | Page |
|---|------|
| Configure the Drive Modules                     | 106  |
| Configure the Logix Sercos interface Module     | 110  |
| Apply Power to the Drive                        | 126  |
| Test and Tune the Axes                          | 129  |
| Configure Drive Parameters and System Variables |      |

Before you begin, make sure you know the characteristics of the following system components.

- Logix processor
- Logix module(s), including the Sercos module
- Kinetix 7000 drive(s) and accessories
- Servo motor(s)/actuator(s)
- Transmission/load for the conversion constant

## **Configure the Drive Modules**

Follow these steps to configure the Kinetix 7000 drive.

1. Verify that there is no power applied to the drive and that the Sercos fiberoptic cables are plugged into the Tx and Rx connectors.

To verify your fiber-optic cable connections, refer to page 100.

**2.** Set the base node address for the drive by setting the Sercos Node Address switch.

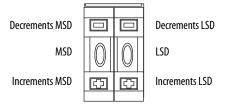

Valid node addresses are 01...99. The left-hand switch sets the most significant digit (MSD) and the right-hand switch sets the least significant digit (LSD).

See the table and figure below for switch operation.

**Table 52 - Node Addressing Switch Settings** 

| То                                   | Press                 |  |
|--------------------------------------|-----------------------|--|
| Increment the (MSD/LSD) node address | The plus (+) switch.  |  |
| Decrement the (MSD/LSD) node address | The minus (-) switch. |  |

Figure 64 - N ode Addressing Switch Settings

#### **IMPORTANT**

When two or more drives are connected to the same Sercos interface module, each node address must be unique.

See the node addressing examples beginning on page 108.

**3.** Cycle control power to initialize the drive.

| IMPORTANT | The base node address setting takes effect only after the drive is |  |
|-----------|--|--|
|           | initialized.   |  |

**4.** Set the Sercos communication rate using DIP<sup>TM</sup> switches 2 and 3.

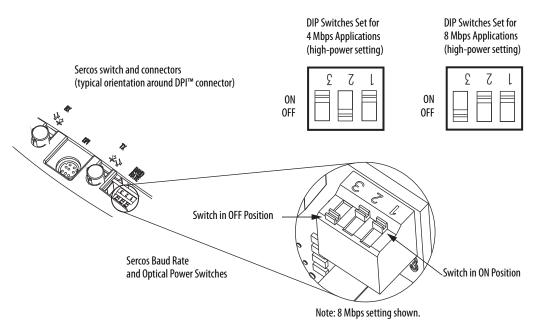

| For This Communication Rate | Set Switch 2 | Set Switch 3 |
|-----------------------------|--------------|--------------|
| 4 Mbps                      | OFF          | ON           |
| 8 Mbps                      | ON           | OFF          |

**5.** Set the Sercos optical power level to High using DIP switch 1.

| For This Optical Power Level | Set Switch 1 |
|------------------------------|--------------|
| Low                          | OFF          |
| High                         | ON           |

**IMPORTANT** All drives on the Sercos ring must have the same communication rate and power setting.

Figure 65 - Sercos DIP Switch Settings and Locations

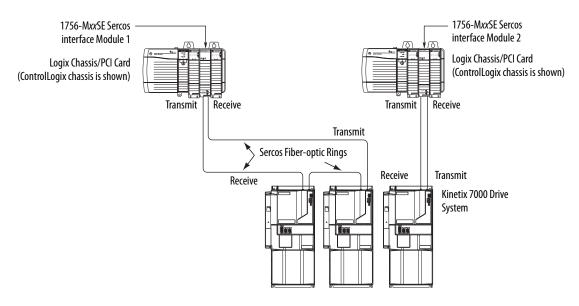

**6.** Repeat <u>Steps 4</u> and <u>5</u> for each Kinetix 7000 drive.

### **Node Addressing Examples**

The examples below illustrate how each axis in the fiber-optic ring is assigned a node address. The ControlLogix® platform is used in the examples, but the node addressing is typical for Logix platforms.

Figure 66 - Node Addressing Example 1

03 = Drive (axis 3) Node Address

02 = Drive (axis 2) Node Address

01 = Drive (axis 1) Base Node Address

In this example, Sercos interface module 1 controls Kinetix 7000 axes 1 and 2. Sercos interface module 2 controls Kinetix 7000 axis 3.

You can mount the two Sercos interface modules in two separate Logix chassis (as shown above) or you can mount them in the same chassis.

Utilizing two Sercos interface modules to control axes from one Kinetix 7000 drive lets you reduce cycle times.

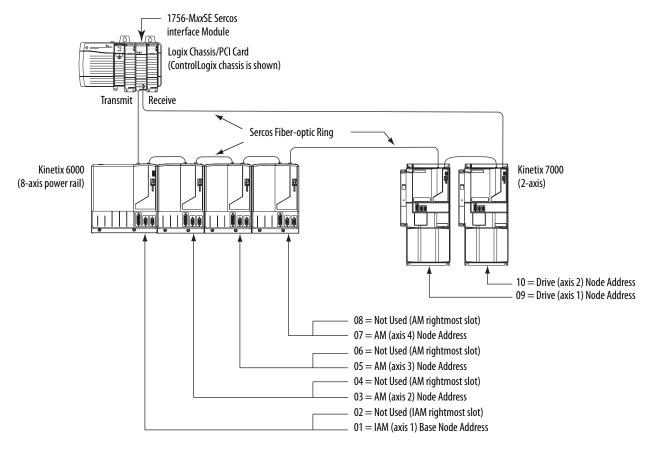

Figure 67 - Node Addressing Example 2

In this example, a Kinetix 6000 (8-axis) power rail contains a double-wide IAM, and three double-wide AMs.

The leftmost slot of a double-wide module determines the node address. So, in the example above, node addresses 02, 04, and 06 (the rightmost slots of the double-wide modules) are not used.

The Kinetix 7000 (2-axis) drive system contains two drives. The base node address of the system must be set for an address of  $\geq 9$ .

# Configure the Logix Sercos interface Module

This procedure assumes that you have wired your Kinetix 7000 system and set the Kinetix 7000 communication rate and optical power switches.

#### **IMPORTANT**

For the Kinetix 7000 drive to communicate with the Sercos interface module (indicated by three solid-green status indicators on the Sercos module), your RSLogix 5000® software must be revision 15.0 or later.

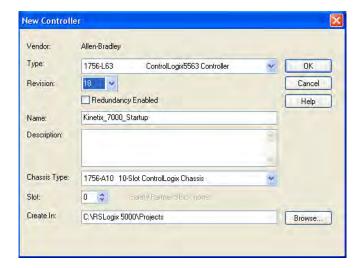

For resources on using RSLogix 5000 software as it applies to configuring the ControlLogix, CompactLogix™, or SoftLogix™ Sercos modules, refer to Additional Resources on page Z.

# **Configure the Logix Controller**

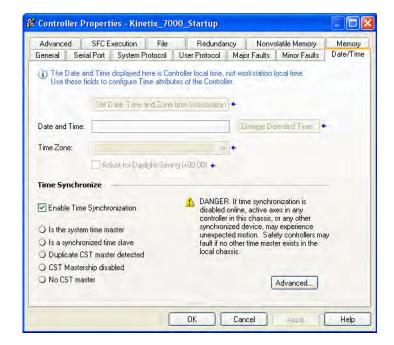

Follow these steps to configure the Logix controller.

- 1. Apply power to your Logix chassis containing the Sercos interface module and open your RSLogix 5000 software.
- 2. From the File menu, choose New.

The New Controller dialog box opens.

- **3.** Configure the controller.
  - a. From the Type pull-down menu, choose the controller type.
  - b. From the Revision pull-down menu, choose the revision.
  - c. Type the file Name.
  - d. From the Chassis Type pull-down menu, choose the chassis.
  - e. Choose the Logix processor Slot.
- 4. Click OK.
- **5.** From the Edit menu, choose Controller Properties.

The Controller Properties dialog box opens.

- 6. Click the Date/Time tab.
- 7. Check Enable Time Synchronization.

This assigns the controller as the Grandmaster clock. The motion modules set their clocks to the module you assign as the Grandmaster.

**IMPORTANT** You can assign only one module in the Logix chassis as the Grandmaster clock.

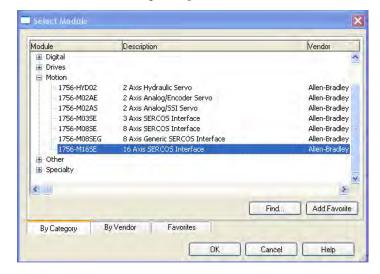

8. Click OK.

# **Configure the Sercos Module**

Follow these steps to configure the Sercos module.

1. Right-click on I/O Configuration in the Controller Organizer and choose New Module.

The Select Module dialog box opens.

2. Expand the Motion category and select 1756-MxxSE, 1756-L60M03SE, 1768-M04SE, or 1784-PM16SE as appropriate for your actual hardware configuration.

In this example, the 1756-M16SE module is selected.

3. Click OK.

The New Module dialog box opens.

- **4.** Configure the module.
  - a. Type the module Name.
  - b. Enter the Logix Sercos module slot (leftmost slot = 0).
  - c. Check Open Module Properties.
- 5. Click OK.

Your new module appears under the I/O Configuration folder in the Controller Organizer and the Module Properties dialog box opens.

**6.** Click the Sercos Interface tab and reference the table below.

| Logix Sercos Module Number of Axes I |          | Data Rate          |
|--------------------------------------|----------|--------------------|
| 1756-M03SE or<br>1756-L60M03SE       | Up to 3  |                    |
| 1756-M08SE                           | Up to 8  | 4 Mbps or 8 Mbps   |
| 1756-M16SE or<br>1784-PM16SE         | Up to 16 | 4 Minhs of G Minhs |
| 1768-M04SE                           | Up to 4  |                    |

- 7. Verify that the Data Rate setting matches DIP switches 2 and 3 (communication rate) as set on the drive, or use the Auto Detect setting.
- **8.** From the Cycle Time pull-down menu, choose the Cycle Time according to the following table.

| Data Rate | Number of Axes          | Cycle Time |  |
|-----------|-------------------------|------------|--|
|           | Up to 2                 | 0.5 ms     |  |
| 4 Mbps    | Up to 4                 | 1 ms       |  |
| 4 Minhs   | Up to 8                 | 2 ms       |  |
|           | No support for axes 916 |            |  |
|           | Up to 4                 | 0.5 ms     |  |
| 8 Mbps    | Up to 8                 | 1 ms       |  |
|           | Up to 16                | 2 ms       |  |

TIP The number of axes/module is limited to the number of axes as shown in <u>step 6</u>.

- **9.** Verify that the Transmit Power setting (high) matches the Optical Power DIP switch 1 as set on the drive.
- **10.** Enter the Transition to Phase setting.

The Transition to Phase default setting is 4 (phase 4). The Transition to Phase setting stops the ring in the phase specified.

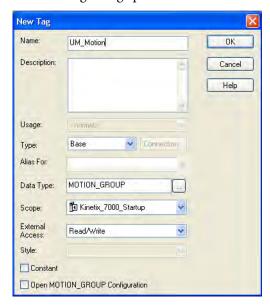

- 11. Click OK.
- **12.** Repeat steps 1...11 for each Sercos module.

# **Configure the Motion Group**

Follow these steps to configure the motion group.

 Right-click Motion Groups in the Controller Organizer and choose New Motion Group.

The New Tag dialog opens.

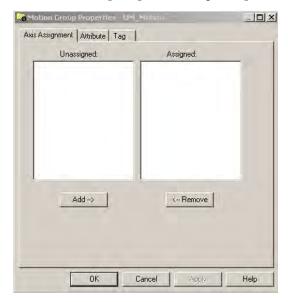

- **2.** Type the new motion group Name.
- 3. Click OK.

The new motion group appears under the Motion Groups folder.

**4.** Right-click the new motion group and select Properties.

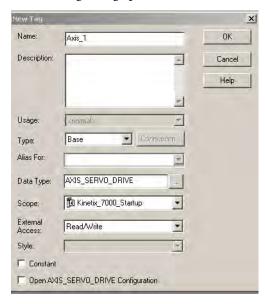

The Motion Group Properties dialog box opens.

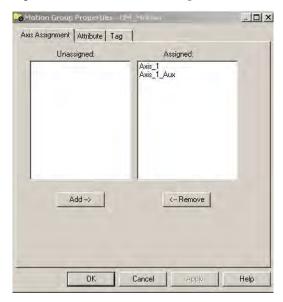

No axis have been created yet. For this setup, a servo axis named Axis\_1 and a feedback only axis named Axis\_1\_Aux will be created. Both axes will be assigned to the Kinetix 7000 axis in the Configure the Kinetix 7000 Drive Modules section.

- 5. Right-click the Motion group name created and select New Axis.
- **6.** Select an Axis\_Servo\_Drive (Sercos controlled axis).

The New Tag dialog opens.

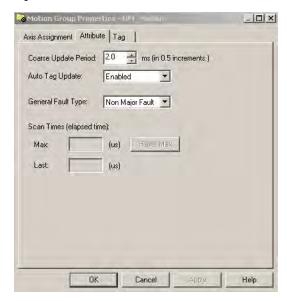

- 7. Type Axis\_1 (or the name of your axis) in the Name field. Axis\_Servo\_Drive is the correct Data Type.
- 8. Click Ok.
- **9.** Repeat steps 5 and 6 above for the Axis\_1\_Aux Feedback Only axis.
- 10. Right-click on the Motion Group name created and select Properties.

Both Axis\_1 and Axis\_1\_Aux are Assigned to the Motion Group. This means both axis will be part of the Sercos and Motion planner updates from/to the controller/Sercos card/drive.

## 11. Open the Attribute folder.

The Motion Planner coarse update period must be set according to the application needs. Guidelines for the coarse update period for the processor that is used and the number of servo drive axes created in the motion group can be found in the following resources.

- Rockwell Automation Knowledgebase at: rok.auto/knowledgebase/
- Sercos and Analog Motion Configuration and Startup User Manual, publication <u>MOTION-UM001</u>
- The various Logix controller user manuals

Only 1 Motion group per processor is allowed.

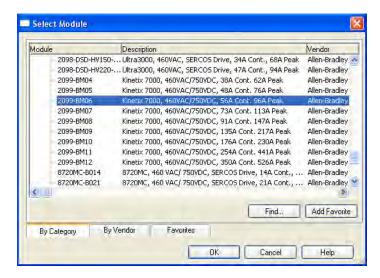

#### 12. Click Ok.

# **Configure the Kinetix 7000 Drive Modules**

Follow these steps to configure the Kinetix 7000 drive modules.

1. Right-click the Logix module you just created and choose New Module.

The Select Module dialog box opens.

2. Expand the Drives category and select your drive as appropriate for your actual hardware configuration.

#### **IMPORTANT**

In order for the Kinetix 7000 drive to communicate with the Sercos interface module (indicated by three solid-green status indicators on the Sercos module), your RSLogix 5000 software must be revision 15.0 or later.

3. Click OK.

The New Module dialog box opens.

- **4.** Configure the new drive module.
  - a. Type the module Name.
  - b. Enter the Node address.

Set the node address in the software to match the node setting on the drive. See Configure the Drive Modules, step 2, on page 106.

- c. Check Open Module Properties.
- 5. Click OK.
- **6.** Select the Associated Axes tab.

7. Assign Axis\_1 to Node 1 in the Associated Axis folder. This assigns Axis 1 in the motion group to the Kinetix 7000 drive at node address 1. Select the Associated Axes tab.

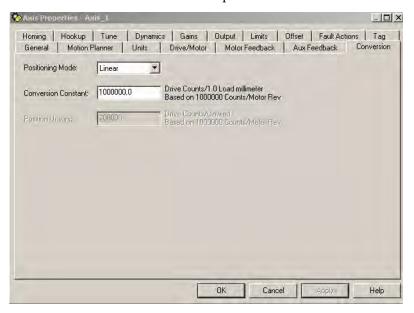

- 8. Click Apply.
- **9.** Click next to Axis\_1.

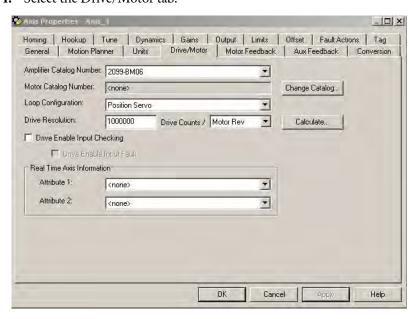

The Axis Properties dialog box opens on the General tab.

- **10.** Select the Units tab.
- **11.** Select the correct position units to be used in your application. This example uses load millimeter.

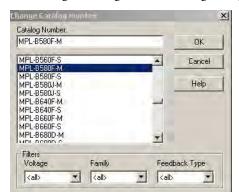

12. Select the Conversion tab. Based on the type of application, the system can be configured for a linear or rotary system. To simplify the setup, a linear system is utilized. The calculate tool on the Drive/Motor tab will be used to set the drive resolution and conversion constant. If a rotary system is used, the Drive/Motor tab calculate tool will be used to set the drive resolution, conversion constant, and position unwind.

- 13. Click Apply.
- 14. Select the Drive/Motor tab.

**15.** Click Change Catalog in order to select the appropriate motor for configuration.

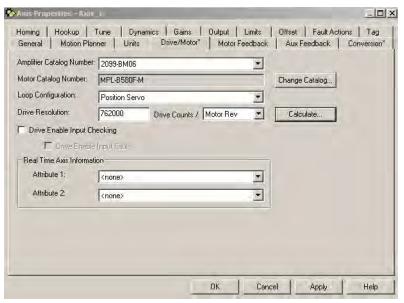

**16.** The Change Catalog Number dialog box appears.

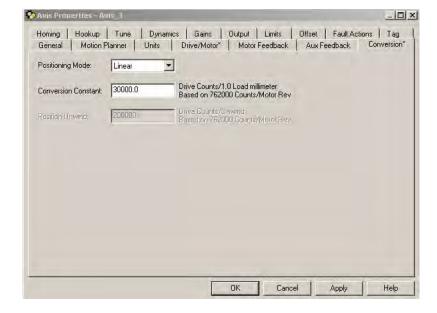

- 17. Select the appropriate motor catalog number for your application. It is important to verify the motor catalog number on the motor nameplate and in your design specification.
- 18. Click OK.
- **19.** Click Calculate, to configure the drive resolution and conversion constant. The position unwind is also calculated if rotary load is used.
- **20.** In this example, a linear load is used and a 25.4 mm (1 in.) movement on a ballscrew is made with every 1 motor revolution. The total position movement on the ballscrew is 254 mm (9.8 in.).

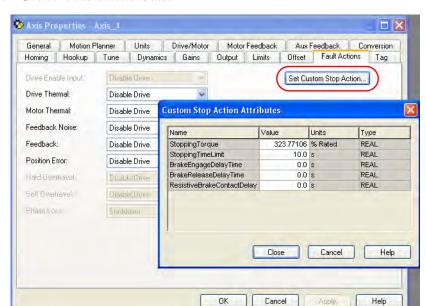

- 21. Click Update.
- 22. Click Close.
- 23. The Drive Enable Input Checking is selected by default. When checked (default) a hard drive enable input signal on the IOD connector (pin 2) is required. Uncheck Drive Enable Input Checking if a hard drive enable input signal is not required.

The Drive/Motor tab and Conversion tabs should look similar to these examples or reflect your application configuration.

24. Click the Fault Actions tab.

25. Click Set Custom Stop Action.

The Custom Stop Action Attributes dialog box opens and lets you set delay times for servo motors with a brake and resistive brake modules. For recommended motor brake delay times, see Kinetix 7000 Design Guide, publication <u>KNX-RM007</u>.

- **26.** Configure the delay times.
  - a. Type the Brake Engage Delay Time.
  - b. Type the Brake Release Delay Time.
  - c. Set the Resistive Brake Contact Delay time (0...1000 ms range).
  - d. Click Close.
- 27. Click OK.
- **28.** In the Module Properties > Associated Axes tab, select the auxiliary axis Axis\_1\_Aux and click Apply.
  - TIP The base node is the servo axis utilizing the motor feedback, and the base node (plus 128) is a feedback-only axis utilizing the auxiliary feedback port (as shown below).

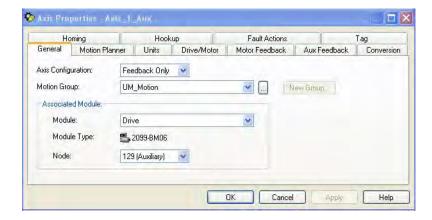

Axis\_1\_Aux is configured similar to Axis\_1, except that only a feedback device is configured.

**29.** Configure the Auxiliary Axis properties. Click \_\_\_\_ next to Axis\_1\_Aux.

The Axis Properties dialog box opens on the General tab.

If an axis is associated to the auxiliary axis node, set the Axis Configuration on the General tab of the Axis Properties dialog box to Feedback Only.

- **30.** Select the Units tab and configure the same as in steps 10...13 of this procedure.
- **31.** Select the Conversion tab and configure the same as in steps 10...13 of this procedure.
- 32. Select the Drive/Motor tab.

The Drive/Motor tab displays the amplifier being used and the Loop Configuration is Aux Feedback Only. This is the only choice if the amplifier is using the primary node for Servo (motor) configuration.

- **33.** Configure the drive resolution / conversion constant (position unwind, if rotary) as in step 19...22 of this procedure.
- 34. Click the Aux Feedback tab.

#### **IMPORTANT**

The Aux Feedback tab must be configured for the auxiliary feedback type being used. In this example, an SRM feedback device is being used.

- **35.** From the Feedback Type pull-down menu, choose the feedback type appropriate for your auxiliary feedback motor.
- **36.** Click Apply.
- 37. Click OK.
- **38.** In the Module Properties, click the Power tab.

**39.** From the Bus Regulator Configuration pull-down menu, choose the component appropriate for your actual hardware configuration. Note: The Kinetix 7000 drive internal dynamic brake IGBT is not utilized by the drive main control for bus regulation therefore any type of regulation must come from an external source.

| If your drive requires             | Then choose   |
|------------------------------------|---|
| No bus regulator configuration     | <none></none>   |
| External Shunt configuration       | 1336-M0D-KB005, KB010 or KB050<br>1336-WB009, WB035 or WB110 <sup>(1)</sup> |
| External regeneration power supply | 8720MC-RPS027, 8720MC-RPS065, or 8720MC-RPS190 (2)(3)(4)                    |

- (1) External shunt configuration 1336 MOD-KBxxx and 1336-WBxxx are no longer available for new sale but are selectable as of this manual release.
- (2) 8720MC-RPSxxx is an external regenerative converter system used to regulate the DC bus that is connected to the Kinetix 7000 drive. Selecting this device requires the Kinetix 7000 drive GPIO terminal block pins 7 and 8 to be wired. See Figure 75 on page 165 for an example.
- (3) 8720MC-RPS027BM-HV1 is no longer available for sale.
- (4) 8720MC-RPS065BM-HV1 has been superseded by 8720MC-RPS065BM-HV2.
- 40. Click OK.
- **41.** Repeat steps 1...27 for each additional axis.
- **42.** Verify your Logix program and save the file.

# **Download the Program**

After completing the Logix configuration, you must download your program to the Logix processor.

# **Apply Power to the Drive**

This procedure assumes that you have completed the following tasks:

- Wired your Kinetix 7000 drive.
- Connected your Logix controller, Sercos interface module fiber-optic connections to your Kinetix 7000 drive.
- Configured and verified a RSLogix 5000 program.
- Connected the motor power and motor feedback cables to your Kinetix 7000 drive.

**SHOCK HAZARD:** To avoid hazard of electrical shock, complete all mounting and wiring before applying power. Once power is applied, connector terminals may have voltage present even when not in use.

See the Line Interface Module Installation Instructions, publication 2094-IN005, when troubleshooting the LIM status indicators, and for the location of LIM circuit breakers, connectors, and status indicators.

Follow these steps to apply power to the Kinetix 7000 system.

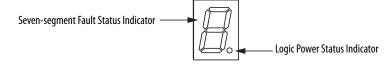

**ATTENTION:** To avoid personal injury or damage to equipment, disconnect the load to the motor. Make sure that each motor is free of all linkages when initially applying power to the system.

1. Determine your source of control power.

| If Your Control Power            | Then   |
|----------------------------------|--|
| ls sourced from a LIM<br>module  | <ol> <li>Verify that the LIM CB1, CB2, and CB3 are in the OFF position.</li> <li>Apply three-phase input power to the LIM VAC Line connector.</li> <li>Set CB3 to the ON position.</li> <li>Set CB2 to the ON position.</li> <li>Go to main step 2.</li> </ol> |
| ls not sourced from a LIM module | <ol> <li>Apply 24V DC control power to the drive (CP connector).</li> <li>Go to main step 2.</li> </ol>  |

2. Verify the status of the drive logic power status indicator.

| If the Logic Power Status Indicator is | Then   |
|--|--|
| ON                                     | Go to step 3.  |
| Not ON                                 | Check your control power connections.     Return to main <u>step 1</u> . |

**3.** Define the three-phase input power as described below.

| If Your Three-phase Power        | Then   |
|----------------------------------|--|
| Is sourced from a LIM module     | <ol> <li>Set the LIM CB1 to the ON position.</li> <li>Verify that the LIM, IPL, and OPL connections for phase-to-phase voltage is 324528V AC (460V).</li> <li>Verify that the input voltage at terminals R (L1), S (L2), and T (L3) on the Kinetix 7000 drive is 324528V AC (460V).</li> <li>If used, verify that the Kinetix 7000 drive Hardware Enable Input signal (IOD pin 2) for each axis is off.</li> <li>Go to main step 4.</li> </ol> |
| Is not sourced from a LIM module | Apply 324528V AC (460V) input power to the Kinetix 7000 drive R (L1), S (L2), and T (L3) input terminals.     If used, verify that the Kinetix 7000 drive Hardware Enable Input signal (I0D pin 2) is off.     Go to main step 4.  |

**4.** Observe the seven-segment fault status indicator display on the drive.

The status indicator will first flash the Sercos node address, then cycle through phases until final configuration (phase 4) is reached.

| Kinetix 7000 Drive Status Indicator   | Status   | Do This   |
|---------------------------------------|--|---|
| Actively cycling (phase 0)            | The drive is looking for a closed Sercos ring. Wait for phase 1 or take corrective action until you reach phase 1.       | Check fiber-optic connections.  |
| Displaying a fixed 1 (phase 1         | The drive is looking for active nodes. Wait for phase 2 or take corrective action until you reach phase 2.               | Check node addressing.  |
| Displaying a fixed 2 (phase 2)        | The drive is configuring nodes for communication. Wait for phase 3 or take corrective action until you reach phase 3.    | Check program motor and drive configuration against installed hardware. |
| Displaying a fixed 3 (phase 3)        | The drive is configuring device-specific parameters. Wait for phase 4 or take corrective action until you reach phase 4. | Check motor catalog number against selection. (1)                       |
| Displaying a fixed 4 (phase 4)        | The drive is configured and active.  | Go to step 5.   |
| Flashing an E followed by two numbers | Drive is faulted.  | Go to Error Codes on page <u>138</u> .                                  |

<sup>(1)</sup> To get diagnostic information from the module, highlight the module name in RSLogix 5000 software. A Pseudo Key Failure often indicates that the motor selection does not match the motor installed.

# **5.** Observe the three status indicators on the front of the drive.

| Status Indicator | Condition                     | Status   | Do This   |
|------------------|-------------------------------|--|---|
| Drive            | Off                           | Normal condition                               | Observe the Comm status LED.  |
| Dilve            | Steady red                    | Drive is faulted                               | Go to Status Indicators on page <u>143</u> .  |
|                  | Flashing green                | Establishing communication with network        | Wait for steady green.  |
| Comm             | Steady green                  | Communication is ready                         | Observe the Bus status LED  |
| [1               | Off                           | No ring present                                | Go to Interpret Error Codes and Status Indicators on page <u>138</u> .  |
| Bus              | Steady green                  | Axis is enabled when status should be disabled | <ol> <li>Verify Hardware Enable Input (IOD-2) is open.</li> <li>Verify MSO instruction is not commanded in RSLogix 5000 software.</li> <li>Return to Apply Power to the Drive on page 126.</li> </ol> |
|                  | Flashing green <sup>(1)</sup> | Bus is up, axis is disabled (normal status)    | Go to step 6.   |
|                  | Off                           | DC bus is not present                          | Go to Status Indicators on page <u>143</u> .  |

<sup>(1)</sup> The follower drive has a 2.5 second delay after DC bus voltage is applied before the Bus Status LED begins flashing. This provides the common bus leader time to complete precharge.

# **6.** Observe the three Sercos status indicators on the Sercos module.

| Sercos Status Indicators                        | Status                     | Do This   |
|---|----------------------------|---|
| Flashing green and red                          | Establishing communication | Wait for steady green on all three LEDs.  |
| Steady green                                    | Communication is ready     | Go to Test and Tune the Axes on page <u>129</u> .                                 |
| Not flashing green and red/<br>not steady green | Sercos module is faulted   | Go to the appropriate Logix manual for specific instructions and troubleshooting. |

# **Test and Tune the Axes**

This procedure assumes that you have configured your Kinetix 7000 drive, your Sercos interface module, and applied power to the system.

For help using RSLogix 5000 software as it applies to testing and tuning your axes with ControlLogix, CompactLogix, or SoftLogix Sercos modules, refer to Additional Resources on page Z.

## **Test the Axes**

Follow these steps to test the axes.

1. Verify that the load was removed from each axis.

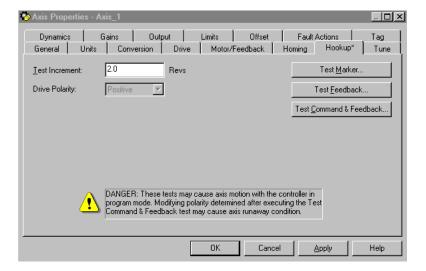

**ATTENTION:** To reduce the possibility of unpredictable motor response, tune your motor with the load removed first, then reconnect the load and perform the tuning procedure again to provide an accurate operational response.

2. Right-click an axis in your Motion Group folder and choose Properties.

The Axis Properties dialog box opens.

3. Click the Hookup tab.

**4.** Type 2.0 as the number of revolutions for the test or another number more appropriate for your application.

| This Test                 | Performs this Test   |
|---------------------------|--|
| Test Marker               | Verifies marker detection capability as you rotate the motor shaft.  |
| Test Feedback             | Verifies feedback connections are wired correctly as you rotate the motor shaft.   |
| Test Command and Feedback | Verifies that motor power and feedback connections are wired correctly as you command the motor to rotate. Also, lets you define polarity. |

5. If Drive Enable Input Checking was selected in step 18 of the Configure the Kinetix 7000 Drive Modules section, apply Hardware Enable Input signal (IOD-2) for the axis you are testing.

**ATTENTION:** To avoid personal injury or damage to equipment, apply 24V ENABLE signal (IOD-2) only to the axis you are testing.

**ATTENTION:** The drive will enable the power module at the appropriate time during hookup and autotune.

**6.** Select the Test (Marker/Feedback/Command and Feedback) to verify connections.

The Online Command dialog opens. Follow the on-screen test instructions. When the test completes, the Command Status changes from Executing to Command Complete.

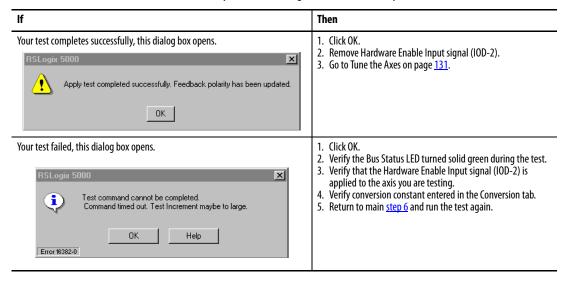

#### 7. Click OK.

The Online Command - Apply Test dialog opens (Feedback and Command & Feedback tests only). When the test completes, the Command Status changes from Executing to Command Complete.

#### 8. Click OK.

9. Determine if your test completed successfully.

## **Tune the Axes**

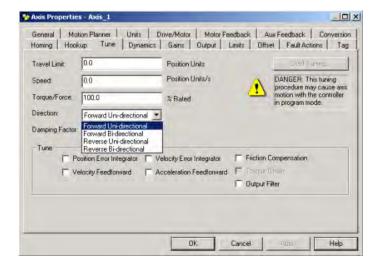

Follow these steps to tune the axes.

1. Verify the load is still removed from the axis being tuned.

**ATTENTION:** To reduce the possibility of unpredictable motor response, tune your motor with the load removed first, then reconnect the load and perform the tuning procedure again to provide an accurate operational response.

2. Click the Tune tab.

3. Enter values for Travel Limit and Speed.

In this example, Travel Limit = 5 and Speed = 10. The actual value of programmed units depend on your application.

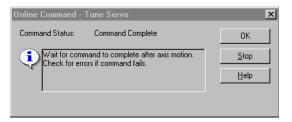

- **4.** From the Direction pull-down menu, choose a setting (Forward Unidirectional is default).
- **5.** Check Tune boxes as appropriate for your application.
- **6.** Apply Hardware Enable Input signal (IOD-2) for the axis you are tuning.

**ATTENTION:** To avoid personal injury or damage to equipment, apply 24V ENABLE signal (IOD-2) only to the axis you are tuning.

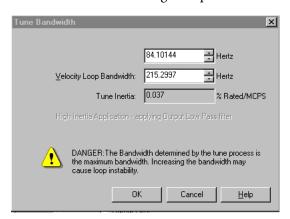

7. Click Start Tuning to autotune your axis.

The Online Command - Tune Servo dialog box opens. When the test completes, the Command Status changes from Executing to Command Complete.

8. Click OK.

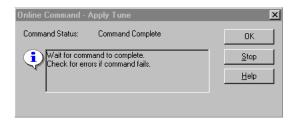

The Tune Bandwidth dialog box opens.

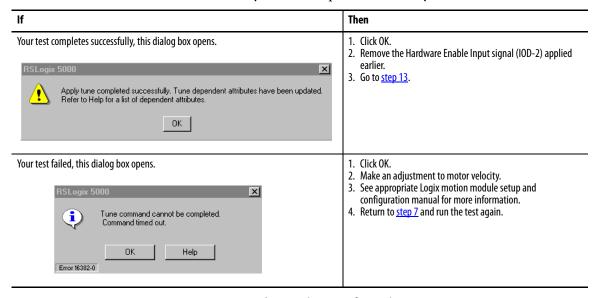

Actual bandwidth values (Hz) depend on your application and may require adjustment once motor and load are connected.

- **9.** Record your bandwidth data for future reference.
- 10. Click OK.

The Online Command - Apply Tune dialog box opens. When the test completes, the Command Status changes from Executing to Command Complete.

- 11. Click OK.
- 12. Determine if your test completed successfully.

13. Repeat Test and Tune the Axes for each axis.

# Configure Drive Parameters and System Variables

This section provides information for accessing and changing parameters not accessible through RSLogix 5000 software.

# **Tools for Changing Parameters**

Most parameters are accessible through RSLogix 5000 software. Alternatives include the DPI compatible Human Interface Module (HIM), and DriveExplorer™ and DriveExecutive™ software.

Table 53 - Software For Changing Parameters

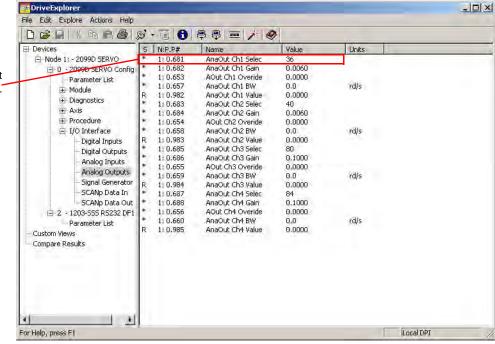

| Method        | Description                | Cat. No.                            | Firmware Revision |
|---------------|----------------------------|-------------------------------------|-------------------|
| DriveExplorer | DriveExplorer software (1) | 9306-4EXP02ENE                      | 2.01 or later     |
|               | Serial to SCANport adapter | 1203-SSS (Series B), or<br>1203-USB | 3.004 or later    |
| Drive HIM     | Full numeric LCD HIM       | 20-HIM-A3 <sup>(2)</sup>            | N/A               |

- (1) See DriveExplorer Getting Results Manual, publication <u>9306-GR001</u>, for instructions.
- (2) Compatible catalog numbers include all 20-HIM-Ax.

#### Change Parameters with DriveExplorer Software

To edit a parameter using DriveExplorer software, refer to the example dialog box below. In this example, the I/O Interface group folder is open and the Analog Outputs file is selected in the tree view pane on the left. The parameters and corresponding elements are displayed in the pane to the right. Double-click a parameter in the list to open the edit dialog box where you can change the value for the desired parameter.

Figure 68 - DriveExplorer Software Example

Double-click a parameter in the list to open the edit dialog box.

# Change Parameters with the HIM Module

When using the HIM module to monitor or change parameters, use the up and down arrows ( $\land$  and  $\lor$ ) to arrive at selections. See the instructions that came with your HIM module for more information.

Follow these steps to monitor or change parameters with the HIM module.

- 1. Select parameter, and press  $\rightarrow$ .
- 2. Select I/O AM1 Group (for IAM module), and press 

  .
- - b. For Analog Output 2 use arrows to select, and press  $\rightarrow$ .
- 4. Press Sel.
- **5.** Enter parameter number, and press  $\rightarrow$ .

Notes:

# **Troubleshoot the Kinetix 7000 Drive System**

This chapter provides troubleshooting tables for your Kinetix\* 7000 system components.

| Торіс                                       |  |
|---|--|
| Safety Precautions                          |  |
| Interpret Error Codes and Status Indicators |  |
| General System Anomalies                    |  |
| Logix/Drive Fault Behavior                  |  |

#### **IMPORTANT**

Equipment connected to the Kinetix 7000 drive may store error data, and may take precedence when troubleshooting the system.

For example, the regenerative power supply (8720MC-RPSxxxxx) should be examined first when the DC common bus is providing system power.

See the product manuals listed in the Additional Resources section on page  $\underline{\mathbf{7}}$  for troubleshooting information on other products.

# **Safety Precautions**

Observe the following safety precautions when troubleshooting your Kinetix 7000 drive.

**ATTENTION:** Capacitors on the DC bus may retain hazardous voltages after input power has been removed. Before working on the drive, measure the DC bus voltage to verify it has reached a safe level or wait the full-time interval as indicated in the warning on the front of the drive. Failure to observe this precaution could result in severe bodily injury or loss of life.

**ATTENTION:** Do not attempt to defeat or override the drive fault circuits. You must determine the cause of a fault and correct it before you attempt to operate the system. Failure to correct the fault could result in personal injury and/or damage to equipment as a result of uncontrolled machine operation.

**ATTENTION:** Provide an earth ground for test equipment (oscilloscope) used in troubleshooting. Failure to ground the test equipment could result in personal injury.

# Interpret Error Codes and Status Indicators

See these troubleshooting tables to identify faults, potential causes, and the appropriate actions to resolve the fault. If the fault persists after attempting to troubleshoot the system, please contact your Rockwell Automation sales representative for further assistance.

## **Error Codes**

Common hardware errors that prevent a drive from completing the power sequencing and fault assessment are listed first. Error codes that may appear on the Fault Status display immediately follow the startup errors.

When a fault is detected, the seven-segment status indicator displays an E followed by the flashing of the two-digit error code, one digit at a time. This is repeated until the error code is cleared.

**Table 54 - Seven-segment Status Indicator Error Codes** 

| Error<br>Code | Fault Message in RSLogix™                        | Anomaly or Symptom                | Potential Cause  | Possible Resolution  |
|---------------|--|-----------------------------------|--|--|
|               |  | Power (PWR) indicator not         | No AC power or auxiliary logic power.                    | Verify that AC control power is applied to the Kinetix 7000 system.  |
|               |  | ON                                | Internal power supply malfunction.                       | Call your Rockwell Automation sales representative to return module for repair.                              |
| No Error      | Code Displayed                                   |                                   | Motor wiring arror                                       | Check motor wiring.  |
|               |  | Motor jumps when first enabled    | Motor wiring error.                                      | Run Hookup test in RSLogix 5000® software.   |
|               |  |                                   | Incorrect motor chosen.                                  | Verify that the proper motor is selected.  |
|               |  | Digital I/O not working correctly | I/O power supply disconnected.                           | Verify connections and I/O power source.   |
|               | MotorOvertemp Fault Motor thermal switch tripped |                                   | High motor ambient temperature and/or excessive current. | Operate within (not above) the continuous torque rating for the ambient temperature, 40 °C (104 °F) maximum. |
| E04           |  |                                   |  | Lower ambient temperature, increase motor cooling.   |
|               |  | tripped                           | Motor wiring error.                                      | Check motor wiring at MF connector on the drive.   |
|               |  |                                   | Incorrect motor selection.                               | Verify that the proper motor has been selected.  |
|               |  |                                   | Mechanical failure.                                      | Check for motor bearing failure or machine jam.  |

Table 54 - Seven-segment Status Indicator Error Codes (Continued)

| Error<br>Code | Fault Message in RSLogix™ | Anomaly or Symptom  | Potential Cause  | Possible Resolution  |
|---------------|---------------------------|---|--|--|
|               |                           |   | Motor cables shorted.  | Verify continuity of motor power cable and connector.  |
|               |                           |   | Motor winding shorted internally.  | Disconnect motor power cables from the motor. If the motor is difficult to turn by hand, it may need to be replaced.   |
|               |                           |   | Drive temperature too high.  | Check for clogged vents or defective fan.  |
| E05           | DriveOvercurrent Fault    | Inverter Overcurrent (IOC) indicates a major power                                |  | Verify that cooling is not restricted by insufficient space around the unit.   |
| E03           | Driveovercurrent rauit    | related fault condition.  |  | Verify that ambient temperature is not too high.   |
|               |                           |   | Operation above continuous power rating and/or product environmental ratings.      | Operate within the continuous power rating.  |
|               |                           |   |  | Reduce acceleration rates.   |
|               |                           |   | Kinetix 7000 drive has a short-circuit, overcurrent, or failed component.          | Remove all power and motor connections, and perform a continuity check from the DC bus to the U, V, and W motor outputs. If a continuity exists, check for wire fibers between terminals, or send drive in for repair. |
|               |                           | Axis moved beyond the   |  | Check wiring.  |
| E06           | HardOvertravelFault       | physical travel limits in the   | Dedicated overtravel input is inactive.  | Verify motion profile.   |
|               |                           | positive/negative direction.  |  | Verify axis configuration in RSLogix 5000 software.  |
| E07           | MotFeedbackFault          | The feedback wiring is open,  | charted armissing  | Check motor encoder and wiring.  |
| EU/           | Motreeupackrauit          | The reeuback wiring is open,  | shorted, of missing.   | Run Hookup test in RSLogix 5000 software.  |
|               | BusUndervoltageFault      | With three-phase power present, the DC bus voltage is below precharge limits.     | Bus voltage for 460V system is below 275V<br>DC.                                   | Verify voltage level of the incoming AC power.   |
|               |                           |   |  | Verify integrity and consistency of AC power source.   |
| E09           |                           |   |  | Install an uninterruptible power supply (UPS) on your AC input.  |
|               |                           | DC bus voltage fell below<br>the undervoltage limit<br>while an axis was enabled. | Bus voltage is at least 180V DC below the precharge level of 323 525V DC.          | Verify that the bus supply is OK.  |
|               |                           |   |  | Disable axis before removing input power.  |
|               |                           |   | One of more phases of AC input power failed.                                       | Check AC input power on all phases.  |
|               |                           |   | Excessive regeneration of power.   | Change the deceleration or motion profile.   |
|               |                           |   | When the motor is driven by an external mechanical power source, it may regenerate | Use a larger system (motor and drive).   |
| E10           | DriveOvervoltageFault     | The DC bus voltage is above   | too much peak energy through the drive's   | Install shunt module.  |
| LIU           | Diveovervoltagerauit      | limits.   | power supply. The system faults to save itself from an overload.                   | Install larger active shunt module or regenerative converter module.   |
|               |                           |   | Bus voltage for 460V system is over 800V DC.                                       | Verify line input integrity and that it is within specification.   |
|               |                           | State of Hall feedback inputs   |  | Verify the Hall wiring at the MF connector on the drive.   |
| E11           | MotFeedbackFault          | is incorrect.   | Improper connection.   | Verify 5V power supply to the encoder.   |
|               |                           |   |  | Check feedback device.   |
| E16           | SoftOvertravelFault       |   | are axis position in either the positive or  | Verify motion profile.   |
| L10           | Jord Tel Guyell walt      | negative direction.   |  | Verify overtravel settings are appropriate.  |

Table 54 - Seven-segment Status Indicator Error Codes (Continued)

| Error<br>Code | Fault Message in RSLogix™ | Anomaly or Symptom   | Potential Cause  | Possible Resolution  |
|---------------|---------------------------|--|--|--|
|               | OverSpeedFault            | Motor speed has exceeded 150% of maximum rated speed. The 100% trip point is dictated by the lesser of the user velocity limits or the motor rated |  | Check cables for noise.  |
| E18           |                           |  |  | Check tuning.  |
| LIO           |                           | base speed.  | of the user velocity lifting of the motor faced                        | Check feedback device.   |
|               |                           |  |  | Verify velocity limit settings.  |
|               |                           |  |  | Increase the feed forward gain.  |
|               |                           |  |  | Increase following error limit or time.  |
|               |                           |  |  | Check position loop tuning.  |
| E19           | PositionErrorFault        | Position error limit exceeded.   |  | Verify sizing of system.   |
|               |                           |  |  | Verify mechanical integrity of system within specification limits.   |
|               |                           |  |  | Replace drive.   |
|               |                           |  |  | Use shielded cables with twisted-pair wires.   |
|               |                           |  | The motor encoder encountered an illegal                               | Route the feedback away from potential noise sources.  |
| E20           | MotFeedbackFault          | Motor encoder state error.   | transition.  | Check the system grounds.  |
|               |                           |  |  | Replace the motor/encoder.   |
|               |                           |  |  | Check feedback device and wiring.  |
| E21           | AuxFeedbackFault          | Communication was not esta   | blished with an intelligent encoder.                                   | Verify auxiliary encoder wiring.   |
|               | DriveOvertempFault        |  | The internal filter protecting the drive from overheating has tripped. | Reduce acceleration rates.   |
|               |                           | IPM thermal protection fault   |  | Reduce duty cycle (ON/OFF) of commanded motion.  |
| E23           |                           |  |  | Increase time permitted for motion.  |
|               |                           |  |  | Use larger Kinetix 7000 drive and motor.   |
|               |                           |  |  | Check tuning.  |
|               |                           | •  |  | Verify motor selection.  |
| E30           | MotFeedbackFault          | Communication was not estal  | blished with an intelligent encoder.                                   | Verify the motor supports automatic identification.  |
|               |                           |  |  | Verify motor encoder wiring.   |
|               |                           |  | Wiring error.  | Check motor power wiring.  |
|               |                           |  |  | Check input power wiring.  |
|               |                           |  | Motor internal ground short.   | Replace motor.   |
| E34           |                           | Excessive ground current detected in the converter.  |  | Disconnect motor power cable from drive and enable drive with current limit set to 0. If fault clears, then a wiring error or motor internal problem exists. If fault remains, call your Rockwell Automation sales representative. |
|               |                           |  | Internal malfunction.  | Remove ground from control power input.  |
|               |                           |  |  | Wire control power to use main power as shown in Appendix B.   |
|               |                           |  |  | Add isolation transformer for control power.   |
| E35           | DriveUndervoltageFault    | Converter precharge cycle  | Low AC input voltage.  | Check input AC voltage on all phases.  |
| ביי           | Directive voitagerauit    | failed.  | Internal malfunction.  | Call your Rockwell Automation sales representative.  |

Table 54 - Seven-segment Status Indicator Error Codes (Continued)

| Error<br>Code | Fault Message in RSLogix™   | Anomaly or Symptom   | Potential Cause  | Possible Resolution   |
|---------------|---|--|--|---|
| E37           | PowerPhaseLossFault   | One or more phases of the AC input power is missing.                   |  | Check input AC voltage and fusing on all phases and DC bus.   |
|               |   |  |  | Disable axis before removing power.   |
| E38           | SercosFault   | The Sercos ring is not active after being active and operational.      | Cable disconnected.  | Check that fiber-optic cable is present and properly connected.   |
|               |   |  |  | Verify that there are no impediments to motion at startup, such as hard limits.   |
| E39           | DriveHardFault  | Self-sensing Commutation<br>Startup Error.                             | Obstruction prevents motion required for self-sensing startup commutation.   | Increase self-sensing current if high friction or load conditions exist.  |
|               |   |  |  | Check motor or encoder wiring using wiring diagnostics.   |
|               |   |  | Astronomical translation and the second translation and  | Disable the Drive Enable Input fault.   |
| E43           | DriveEnableInnutEault   | Missing Drive Enable input   | Attempted to enable the axis through software while the Drive Enable hardware input was inactive.                        | Verify that Drive Enable hardware input is active whenever the drive is enabled through software.                         |
| E43           | DriveEnableInputFault   | signal.  | The Drive Enable input transition from active  | Verify wiring and shielding.  |
|               |   |  | to inactive occurred while the axis was enabled.   | If error persists, return the drive to Rockwell Automation.   |
|               | DriveHardFault  | Safe Torque Off function<br>mismatch. Drive will not<br>permit motion. | Loose wiring at SO connector. Cable/header not seated properly in SO connector. Safe Torque Off circuit missing +24V DC. | Verify wire terminations, cable/header connections, and +24V DC.  |
|               |   |  |  | Reset error and run proof test.   |
| E49           |   |  |  | If error persists, return the drive to Rockwell Automation.   |
|               |   | See the Kinetix Safe Torque Of test procedures.                        | ff Feature Safety Reference Manual, <u>GMC-RM002</u> ,   | for additional troubleshooting information and proof  |
| E50           | SercosFault   | Duplicate node address detec   | ted on Sercos ring.  | Verify that each Sercos drive is assigned a unique node address.  |
| E54           | DriveHardFault  | Excessive Current Feedback<br>Offset.                                  | Defective current feedback sensing.  | If error persists, return the drive to Rockwell Automation.   |
|               |   | Auxiliary Encoder State<br>Error.                                      | The auxiliary encoder encountered an illegal transition.   | Use shielded cables with twisted-pair wires.  |
| E61           | AuxFeedbackFault  |  |  | Route the feedback away from potential noise sources.   |
|               |   |  |  | Check the system grounds.   |
|               |   |  |  | Replace the motor/encoder.  |
| E62           | AuxFeedbackFault  | The feedback wiring is open,   | shorted, or missing.   | Check the motor feedback cable connectors/wiring to the drive and motor.  |
| E63           | AuxFeedbackNoise  | Noise on auxiliary feedback cable.                                     | Recommended grounding, per installation  | Verify grounding.     Route feedback cable away from noise sources.     See System Design for Control of Electrical Noise |
| E64           | MotorFeedbackNoise  | Noise on motor feedback cable.   | instructions, has not been followed.   | Reference Manual, publication <u>GMC-RM001</u> .  |
| F/F           | No Fault Message  | Hardon and a City  | Makes and sailer dealers at 16 at  | Check motor power/feedback wiring.  |
| E65           | (condition indicated by on-screen message)                        | Hookup procedure failed.   | Motor or feedback device malfunction.  | See displayed message for resolution.   |
|               | No Fault Massage  | Autotune procedure failed.   | Motor or feedback device malfunction.  | Check motor power/feedback wiring.  |
| E66           | No Fault Message<br>(condition indicated by on-screen<br>message) |  |  | See displayed message for resolution.   |
|               |   |  |  | Perform Hookup in RSLogix 5000 software.<br>Consult RSLogix 5000 help message.  |

Table 54 - Seven-segment Status Indicator Error Codes (Continued)

| Error<br>Code | Fault Message in RSLogix™                   | Anomaly or Symptom  | Potential Cause   | Possible Resolution  |
|---------------|---|---|---|--|
| E67           | DriveHardFault                              | Operating system failed.  | Software initialization fault detected due to   | Cycle power.   |
| LU7           | Divendiurauit                               | operating system railed.  | hardware failure.   | If fault persists, replace module.   |
| E68           | DriveHardFault                              | DPI™ communication failed.  | The DPI device or cable is faulty.  | Check DPI connections.   |
| E69           | DriveHardFault                              | Nonvolatile memory is corrup  | t due to control board hardware failure.  | Load default parameters, save to nonvolatile memory, and recycle power or reset the drive. |
|               |   |   |   | If fault persists, replace module.   |
| E70           | DriveHardFault                              | Nonvolatile memory is corrup  | t due to control board software error.  | Load default parameters, save to nonvolatile memory, and recycle power or reset the drive. |
|               |   |   |   | If fault persists, replace module.   |
| E71           | DriveHardFault                              | RAM or flash memory validat   | ion failuro   | Cycle power.   |
| L/ I          | Divendiurauit                               | NAME OF HASH MEMOLY VARIABLE  | on idiluic.   | If fault persists, replace module.   |
|               | <b>DriveOvertemp Fault</b> (Drive Overtemp) |   | The drive fan failed.   | Replace the failed module.   |
|               |   | Inverter thermal switch tripped                                       | The cabinet ambient temperature is above rating.  | Check the cabinet temperature. See System Design Guidelines on page <u>20</u> .            |
| E72           |   |   | The machine duty cycle requires an RMS current exceeding the continuous rating of the controller. | Change the command profile to reduce speed or increase time.                               |
|               |   |   | The airflow access to the Kinetix 7000 drive is limited or blocked.                               | Check airflow and remove any fan blockage.   |

# **Status Indicators**

**Table 55 - Drive Status Indicator** 

| Drive Status LED | Status            | Potential Cause                                     | Possible Resolution  |
|------------------|-------------------|---|--|
| Off              | Normal, no faults | N/A   | N/A  |
| Steady Red       | Drive faulted     | Seven-segment status indicator displays error code. | See the Error Codes on page <u>138</u> section and continue troubleshooting. |

## **Table 56 - Comm Status Indicator**

| Comm Status LED                      | Status                          | Potential Cause  | Possible Resolution                                |
|--------------------------------------|---------------------------------|--|--|
| Off                                  | No communication <sup>(1)</sup> | Loose fiber-optic connection.  | Verify proper fiber-optic cable connection.        |
|                                      |                                 | Broken fiber-optic cable.  | Replace fiber-optic cable.                         |
|                                      |                                 | Receive fiber-optic cable connected to Sercos transmit connector and vice versa.         | Check proper Sercos fiber-optic cable connections. |
| communication.  Node address setting |                                 | System is still in the process of establishing Sercos communication.                     | Wait for steady green indicator.                   |
|                                      |                                 | Node address setting on the drive module does not match Sercos controller configuration. | Verify proper node switch setting.                 |
| Steady Green                         | Communication ready             | No faults or failures.   | N/A  |

<sup>(1)</sup> See Fiber-optic Cable Installation and Handling Instructions, publication 2090-IN010, for more information.

#### Table 57 - Bus Status Indicator

| Bus Status LED        | Status   | Condition   |
|-----------------------|--|---|
|                       |  | <ul> <li>Normal when bus power is not applied.</li> <li>Fault exists, see the Interpret Error Codes and Status Indicators beginning on page <u>138</u>.</li> </ul>  |
|                       | Bus power is present in follower drive.                        | <ul> <li>Follower drive is not configured as Common Bus Follow in RSLogix 5000 software.</li> <li>After DC bus voltage is applied, a 2.50 second delay occurs before the indicator begins flashing green.</li> <li>This is normal operation and provides the common bus leader time to complete precharge.</li> </ul> |
| Alternating Red-Green | Bus power not present.<br>24V DC control power is present.     | <ul> <li>Normal when bus power is not applied. Verify 460V AC connections.</li> <li>Fault exists, see the Interpret Error Codes and Status Indicators beginning on page <u>138</u>.</li> </ul>  |
| Flashing Green        | Bus power is present, axis disabled.<br>No faults or failures. | Normal when:  24V is not applied to Hardware Enable Input (IOD-2).  MSO instruction is not commanded in RSLogix 5000 software.  |
| Steady Green          | Bus power is present, axis enabled.<br>No faults or failures.  | Normal when:  • 24V is applied to Hardware Enable Input (IOD-2).  • MSO instruction is commanded in RSLogix 5000 software.  |

Table 58 - Sercos Status Indicator

| Sercos Status                         | Status  | Condition  |  |
|---------------------------------------|---|--|--|
| Actively cycling<br>Phase 0           | The drive is looking for a closed Sercos ring. Wait for phase 1 to complete or take corrective action           | Check fiber-optic connections. Serial ring must enter at the Rx connector and exit TX connector.                 |  |
|                                       | to reach phase 1.   | Baud rate switch settings conflict. Verify drive and Logix setup parameters.                                     |  |
| Displaying a fixed 1<br>Phase 1       | The drive is looking for active nodes. Wait for phase 2 to complete or take corrective action to reach phase 2. | Check node addressing on drive and in ControlLogix® and RSLogix 5000.  |  |
| Displaying a fixed 2                  | Logix is configuring nodes for communication.   | Check RSLogix programming to verify drive configuration against installed hardware.                              |  |
| Phase 2                               | Wait for phase 3 to complete or take corrective action to reach phase 3.  | Verify the appropriate drive model is selected in RSLogix software.  |  |
| Displaying a fixed 3                  | The drive is configuring device specific  | Check RSLogix software programming to verify motor configuration against installed hardware. (1)                 |  |
| Phase 3                               | parameters. Wait for phase 4 to complete or take corrective action to reach phase 4.                            | Verify motor feedback cable connects to MF connector on the drive.   |  |
|                                       |   | If low profile connector is used, verify the connection for correct pinout, pinched insulation, and loose wires. |  |
|                                       |   | Verify motor feedback cable for continuity and shorts.   |  |
|                                       |   | Replace the motor.   |  |
| Displaying a fixed 4<br>Phase 4       | The drive is configured and the Sercos ring is active   | ctive.   |  |
| Flashing an E followed by two numbers | Drive is faulted.   | See the Error Codes section on page . <u>138</u> .   |  |

<sup>(1)</sup> You can access diagnostic information from the module by highlighting the module name in RSLogix 5000 software. A Pseudo Key Failure often indicates that the motor selection does not match the motor installed.

**Table 59 - Control Power Status Indicator** 

| CP Status LED | Status                     | Condition  |  |
|---------------|----------------------------|--|--|
| Off           | Control power not present. | Normal when auxiliary power is not applied to the Control Power (CP) terminal. |  |
| Steady Green  | Control power applied.     | Normal when auxiliary power is applied to the Control Power (CP) terminal.     |  |

# **General System Anomalies**

These anomalies do not always result in a fault code, but may require troubleshooting to improve performance.

| Condition                   | Potential Cause   | Possible Resolution   |
|-----------------------------|---|---|
|                             | The position feedback device is incorrect or open.  | Check wiring.   |
|                             | Unintentionally in Torque mode.   | Check to see what primary operation mode was programmed.  |
|                             | Motor tuning limits are set too high.   | Run Tune in RSLogix 5000 software.  |
|                             | Position loop gain or position controller accel/decel rate is improperly set.   | Run Tune in RSLogix 5000 software.  |
| Axis or system is unstable. | Improper grounding or shielding techniques are causing noise to be transmitted into the position feedback or velocity command lines, causing erratic axis movement. | Check wiring and ground.  |
|                             | Motor Select limit is incorrectly set (servo motor is not matched to axis module).  | Check setups.     Run Tune in RSLogix 5000 software.  |
|                             | Mechanical resonance.   | Notch filter or output filter may be required. See Axis Properties dialog, Output tab in RSLogix 5000 software. |

| Presence of noise on command or motor feedback signal wires.  Line frequency may be present.  Line frequency may be present.  Variable frequency may be velocity feedback ripple or a disturbance caused by gear teeth, ballscrew balls, or other mechanical wear. The frequency may be a multiple of the motor power transmission  RM001.  • Verify grounding.  • Route wire away from noise sources.  • Decouple the motor for verification.  • Check and improve the performance of the gearbox, ballscrew, a   | Condition                          | Potential Cause  | Possible Resolution   |
|--|------------------------------------|--|---|
| The system inertia is excessive.  The system inertia is excessive.  The system inertia is excessive.  The system firction torque is excessive.  The system firction torque is excessive. | The motor connections are loose or open.  Check motor wiring and connections.  |                                    | The motor connections are loose or open.   | Check motor wiring and connections.   |
| Foreign matter is lodged in the motor. Remove foreign matter.  |                                    | Foreign matter is lodged in the motor.   | Remove foreign matter.  |
| The motor load is excessive. Verify the servo system sizing.   | No rotation.                       | The motor load is excessive.   | Verify the servo system sizing.   |
| No rotation. Return the motor for repair.  |                                    | The bearings are worn.   | Return the motor for repair.  |
| The motor brake is engaged (if supplied).  • Check brake wiring and function. • Return the motor for repair.   |                                    | The motor brake is engaged (if supplied).  | 1   |
| The motor is not connect to the load.  Check coupling.   |                                    | The motor is not connect to the load.  | Check coupling.   |
| The duty cycle is excessive.  Change the command profile to reduce accel/decel or increase time.   | Mater everheating                  | The duty cycle is excessive.   | Change the command profile to reduce accel/decel or increase time.  |
| Motor overheating.  The rotor is partially demagnetized, causing excessive motor current.  Return the motor for repair.  | motor overneating.                 | The rotor is partially demagnetized, causing excessive motor current.  | Return the motor for repair.  |

| Condition  | Potential Cause   | Possible Resolution  |
|--|---|--|
| Abnormal noise   | Motor tuning limits are set too high.                                     | Run Tune in RSLogix 5000 software again.   |
|  | Loose parts are present in the motor.                                     | <ul><li>Remove the loose parts.</li><li>Return motor for repair.</li><li>Replace motor.</li></ul>    |
|  | Through bolts or coupling is loose.                                       | Tighten bolts.   |
|  | The bearings are worn.  | Return motor for repair.   |
|  | Mechanical resonance.   | Notch filter may be required (refer to Axis Properties dialog, Output tab in RSLogix 5000 software). |
| Erratic operation -<br>Motor locks into position,<br>runs without control or<br>with reduced torque. | Motor power phases U and V, U and W, or V and W reversed.                 | Check and correct motor power wiring.  |
|  | Sine, Cosine or Rotor leads are reversed in the feedback cable connector. | Check and correct motor feedback wiring.   |
|  | Sine, Cosine, Rotor lead sets of resolver feedback are reversed.          | Check and correct motor feedback wiring.   |

## **Logix/Drive Fault Behavior**

These RSLogix 5000 fault actions are configurable from the Axis Properties dialog box, Fault Actions tab.

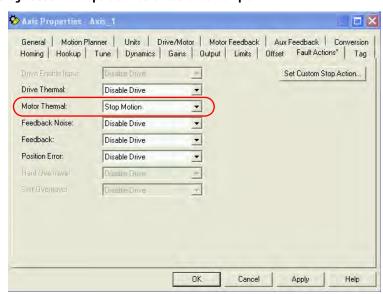

**Table 60 - Drive Fault Action Definitions** 

| Drive Fault Action | Definition   |
|--------------------|--|
| Shutdown           | The drive is disabled and the contactor enable relay opens. An uncontrolled stop occurs, and the motor coasts to a stop.   |
| Disable Drive      | The drive is disabled. An uncontrolled stop occurs, and the motor coasts to a stop.  |
| Stop Motion        | Logix configuration for velocity loop Kp/Ki is followed. When zero speed is reached or stopping time is exceeded, the drive is disabled. Stopping time and stopping torque are configurable parameters in RSLogix 5000 software. |
| Status Only        | Drive continues to operate. Status is provided by the seven-segment status indicator, drive status indicator, and DPI (if used).   |

Only selected faults are programmable. In <u>Table 61</u> on page <u>147</u>, the controlling attribute is given for programmable fault actions.

Figure 69 - RSLogix 5000 Axis Properties - Fault Actions Tab Example

Drive Fault Action/Attribute for Motor Overtemp fault (E04).

**Table 61 - Logix/Drive Fault Behavior Definitions** 

| <b>Logix Fault Message</b><br>(HIM)                     | Error<br>Code      | Description   | Drive Fault Action/<br>Attribute  | RSLogix<br>Programmable<br>Fault Action? |
|---|--------------------|---|---|--|
| MotorOvertempFault<br>(Motor Overtemp)                  | E04 <sup>(1)</sup> | The motor thermal switch was tripped. Firmware 1 <sup>2</sup> t protection does not generate a fault, rather it dynamically folds back current when 110% of motor rating is reached. Setting the Motor Thermal fault action to Status Only will bypass this function. | STOP MOTION / Motor<br>Thermal  | Yes                                      |
| <b>DriveOvercurrentFault</b> (Power Fault)              | E05                | An instantaneous overcurrent was detected in the inverter power section   | SHUTDOWN  | No                                       |
| HardOvertravelFault<br>(+/- Hard Overtravel)            | E06                | Axis moved beyond the physical travel limits in the positive/negative direction. This fault can be configured for status only.  | STOP MOTION / Hard<br>Overtravel  | Yes                                      |
| MotFeedbackFault<br>(Motor Feedback Loss)               | E07                | The feedback wiring is open, shorted or missing.  | DISABLE DRIVE   | No                                       |
| BusUndervoltageFault                                    | E09                | With three-phase present, the DC bus voltage is below limits. The trip point is 800V DC for 460 drives.   | SHUTDOWN  | No                                       |
| (Bus Under Voltage)                                     |                    | DC bus voltage is below limits when any axis on common-bus follower was enabled.  |   |  |
| <b>DriveOvervoltageFault</b> (Bus Overvoltage)          | E10                | The DC bus voltage is above limits. The trip point is 800V DC for 460 drives.   | SHUTDOWN  | No                                       |
| MotFeedbackFault<br>(Illegal Hall State)                | E11                | State of Hall feedback inputs in incorrect.   | DISABLE DRIVE   | No                                       |
| SoftOvertravelFault<br>(+/- Software Overtravel)        | E16                | Axis position exceeded maximum software setting in the positive/negative direction. This fault can be configured for status only.   | STOP MOTION / Soft<br>Overtravel  | Yes                                      |
| OverSpeedFault<br>(Overspeed Fault)                     | E18                | Axis speed has reached 150% of the maximum rated setting. The 100% trip point is dictated by the lesser of the user velocity limits or the motor rated base speed.  DISABLE   |   | No                                       |
| PositionErrorFault<br>(Follow Error)                    | E19                | Axis position error limit has been exceeded. This fault can be configured for status only.  STOP MOTION / Position Error  |   | Yes                                      |
| MotFeedbackFault<br>(Mtr Fdbk AQB)                      | E20                | Motor encoder has encountered an illegal state transition.  | DISABLE DRIVE   | No                                       |
| AuxFeedbackFault<br>(Aux Feedback Comm)                 | E21                | Communication was not established with an intelligent (Stegmann) encoder on the Auxiliary feedback port.  |   | No                                       |
| <b>DriveOvertempFault</b> (Drive Overtemperature Fault) | E23                | An IPM thermal protection fault occurred.   | curred. DISABLE Drive Thermal   |  |
| MotFeedbackFault<br>(Motor Feedback Comm)               | E30                | Communication was not established with an intelligent (Stegmann) encoder on the motor feedback port.  | not established with an intelligent (Stegmann) encoder on the STOP MOTION |  |
| <b>GroundShortFault</b> (Ground Fault)                  | E34                | Excessive ground current in the converter was detected.   | SHUTDOWN  | No                                       |
| <b>DriveUndervoltageFault</b> (Precharge Fault)         | E35                | The converter precharge cycle has failed.   | SHUTDOWN  | No                                       |
| PowerPhaseLossFault<br>(Phase Loss Flt)                 | E37                | <ul> <li>One or more phases of the input AC power is missing.</li> <li>Axis was enabled when main (three-phase) power was removed.</li> <li>Common bus follower axis was enabled when DC bus power was removed.</li> </ul>  | SHUTDOWN/ STOP<br>MOTION  | No                                       |
| SercosFault<br>(Sercos Ring Flt)                        | E38                | The Sercos ring is not active after being active and operational.   | STOP MOTION   | No                                       |
| <b>DriveHardFault</b> (Self Sense Flt)                  | E39                | Self-sensing commutation fault detected   | DISABLE DRIVE   | No                                       |
| <b>DriveEnableInputFault</b> (Drive Enable Flt)         | E43                | Generated when Enable input switches off when drive is enabled.   | STOP MOTION   | Yes                                      |
| <b>DriveHardFault</b><br>(Safe Torque Off HW Flt)       | E49                | Safe Torque Off function mismatch. Drive will not permit motion. See the Kinetix Safe Torque Off Feature Safety Reference Manual, publication GMC-RM002, for more information. Only applies to drives with Safe Torque Off feature.                                   |   | No                                       |
| SercosFault<br>(Sercos Same ADDR)                       | E50                | Duplicate node address detected on Sercos ring.   | STOP MOTION   | No                                       |
| <b>DriveHardFault</b><br>(Ifbk HW Fault)                | E54                | Current feedback hardware fault detected.   | SHUTDOWN  | No                                       |

| RegenPSOK<br>(CPLD FLT)  | E111          | Regenerative PS+/- missing at GPIO.   | SHUTDOWN                                  | No                                       |
| All Others RESERVED  | 1             |   | l   | I  |

<sup>(1)</sup> The Logix Motor Thermal Fault Action is tied to the motor thermostat fault. If this is set to Shutdown or Disable (in Logix), the drive will fold back the current when the I<sup>2</sup>T calculation indicates that the motor temperature has exceeded 10% of its rated temperature. If it is set to Stop Motion or Status Only, the drive will not fold back the current. The I<sup>2</sup>T calculation never generates a fault.

# **Specifications and Dimensions**

This appendix provides product specifications and mounting dimensions for your Kinetix  $^{\circ}$  7000 system components.

<sup>(1)</sup> Bandwidth values vary based on tuning parameters and mechanical components.

<sup>(2)</sup> Bus undervoltage will vary based on input line voltage.

<sup>(3)</sup> If DC input is supplied to 2099-BM09-S, 2099-BM10-S, 2099-BM11-S, or 2099-BM12-S drives, the precharge capability must be provided at the system level. Disconnect switches must not be used between the input of the drive and a common DC bus without the use of an external precharge device.

## **Circuit Breaker/Fuse Specifications**

While circuit breakers offer some convenience, there are limitations for their use. Circuit breakers do not handle high current inrush as well as fuses.

Make sure the selected components are properly coordinated and meet acceptable codes including any requirements for branch circuit protection. Evaluation of the short-circuit available current is critical and must be kept below the short-circuit current rating of the circuit breaker.

Use class CC, T, RK1, or J fuses, with current rating as indicated in the table below. The following fuse examples and short-circuit current ratings are recommended for use with the 2099-BMxx-S drives when the Line Interface Module (LIM) is not used.

| IMPORTANT | LIM modules (catalog numbers 2094-BLxxS and 2094-XL75S-Cx) provide branch circuit protection to the Kinetix 7000 drive. Follow all applicable NEC |
|-----------|---|
|           | and local codes.  |

## **General Specifications**

## **Maximum Feedback Cable Lengths**

Although motor power and feedback cables are available in standard lengths up to 90 m (295.3 ft), the drive/motor/feedback combination may limit the maximum feedback cable length. These tables assume the use of recommended Kinetix 2090 cables.

Table 65 - Cable Lengths for Compatible Rotary Motors

| Motor Cat. No.   | Absolute (5V) Encoder m (ft) | Absolute (9V) Encoder m (ft) |
|--|------------------------------|------------------------------|
| MPL-B5xxx<br>MPL-B9xxx-S/M   |                              | 90 (295.3)                   |
| MPM-B165 <i>xx</i><br>MPM-B215 <i>xx</i> -S/M                                    |                              | 90 (295.3)                   |

| 2099-BM11-S                    | 1321-3R200-B                                   | 1321-3RA200-B                     | 1321-3R200-C                  | 1321-3RA200-C                                  |  |
| 2099-BM12-S                    | 1321-3RB250-B                                  | 1321-3RAB250-B                    | 1321-3RB250-C                 | 1321-3RAB250-C                                 |  |

<sup>(1)</sup> Input line reactors were sized based on the NEC fundamental motor amps.

Line reactors compatible with a 8720MC-RPS Regenerative Power Supply sourcing input power from an AC power supply are listed below. They must be configured as shown in the Regenerative Power Supply example on page 169.

Table 67 - Compatible Kinetix 7000 Drives, 8720MC-RPS Regenerative Power Supplies and 8720MC Line Reactors

| Kinetix 7000 Drive<br>Cat. No. | 8720MC-RPS Regenerative Power<br>Supply Cat. No. <sup>(1)</sup> | 8720MC Line Reactor<br>Cat. No.  |
|--------------------------------|---|--|
| 2099-BM07-S                    | 8720MC-RPS065BM   | 8720MC-LR05-048B   |
| 2099-BM08-S                    |   |  |
| 2099-BM09-S                    |   | 8720MC-LR10-062B   |
|                                | 8720MC-RPS065BM and<br>8720MC-RPS065BS                          | 8720MC-LR05-048B<br>(requires two units, one for the master<br>RPS unit and one for the slave RPS unit.) |
| 2099-BM11-S                    |   | 8720MC-LR10-062B<br>(requires two units, one for the master<br>RPS unit and one for the slave RPS unit.) |
|                                | 8720MC-RPS190BM   | 8720MC-LR10-100B (required two units)  |
| 2099-BM12-S                    |   |  |

<sup>(1)</sup> Regenerative Power Supply (RPS) selection is for a single motor/drive combination. When combining multiple drives on the same RPS module, the selection will change.

## **External Shunt Modules**

Refer to this table for active shunt solutions for use with Kinetix 7000 drives from Rockwell Automation Encompass® partners.

# Precharge Capacities of the Regenerative Power Supply

Internal (built-in) and external precharge capacities of the regenerative power supply (RPS) are listed below.

| Attribute                                  | 8720MC-RPS065Bx-HV2     | 8720MC-RPS190Bx          |
|--|-------------------------|--------------------------|
| Rated Output kVa (750V DC bus) (1)         | 45                      | 133                      |
| DC Amperes Continuous <sup>(1)</sup>       | 64                      | 190                      |
| DC Amperes Peak (1 minute) (1)             | 96                      | 285                      |
| Built-in Capacitor                         | 1900 μF                 | 7600 μF                  |
| Built-in Resistor (Resistance/W)           | 7000 μF (22 Ohms/120 W) | 25000 μF (10 0hms/400 W) |
| External Resistor (Min Resistance) (2) (3) | 110000 μF (20 0hms)     | 165000 μF (10 Ohms)      |
| External Circuit (Min Resistance) (3)      | 220000 μF (4.7 0hms)    | 495000 μF (1.5 Ohms)     |

<sup>(1)</sup> For 8720MC-RPS065-HV2 and 8720MC-RPS190, you may have up to two slave units with a master unit. Multiply these values by the number of slave units.

#### **IMPORTANT**

Large levels of load capacitance may require modification of the 8720 regenerative power supply internal precharge/discharge circuit.

See the Wiring instructions in the 8720MC Regenerative Power Supply Installation Manual, publication <u>8720MC-RM001</u>, for information on how to determine the appropriate precharge/discharge resistance power value (Ohms/Watt) to accommodate the capacitance of your system.

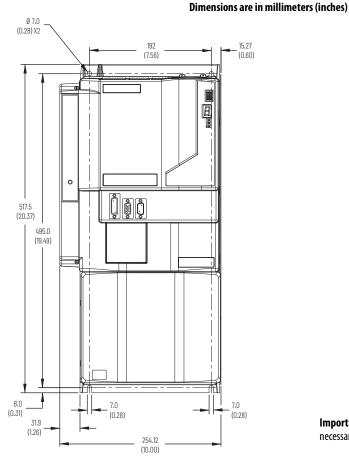

<sup>(2)</sup> Use this case only when the bus capacitance exceeds the internal precharge rating. You must use the specified resistor. Calculate rated wattage and surge resistivity for that resistor. See the 8720MC Regenerative Power Supply Installation Manual, publication 8720MC-RM001, for configuration details.

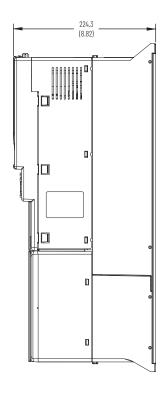

<sup>(3)</sup> Use this case only when the bus capacitance exceeds the external resistor rating. You must use the specified resistor. Calculate rated wattage and surge resistivity for that resistor. See the 8720MC Regenerative Power Supply Installation Manual, publication 8720MC-8M001, for configuration details.

## **Product Dimensions**

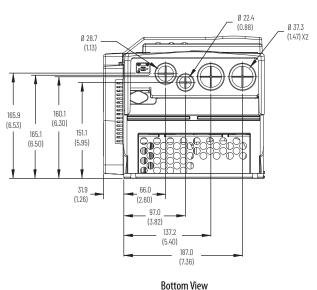

This section provides a quick reference table to common dimensions for Kinetix 7000 drives (height, width, depth, and mounting hole locations), and outline drawings with dimensions related to the specific frame sizes.

Figure 70 - 2099-BM06-S 2099-BM07-S, and 2099-BM08-S Approximate Dimensions

**Important:** Additional clearance below the connector is necessary to provide the recommended cable bend radius.

(2099-BM06-S and 2099-BM07-S)

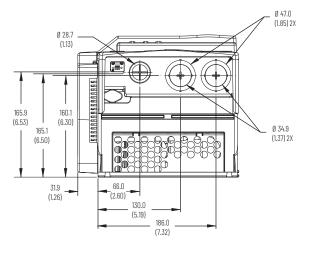

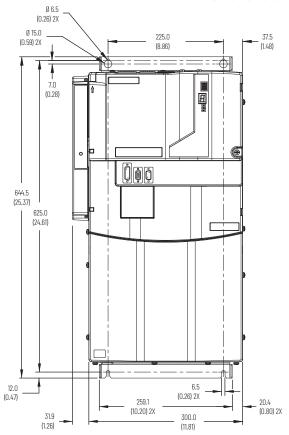

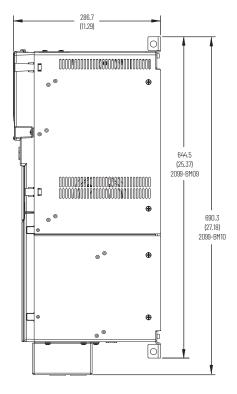

Figure 71 - 2099-BM09-S and 2099-BM10-S Approximate Dimensions

#### Dimensions are in millimeters (inches)

**Important:** Additional clearance below the connector is necessary to provide the recommended cable bend radius.

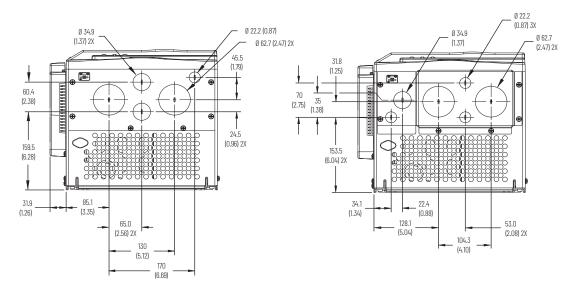

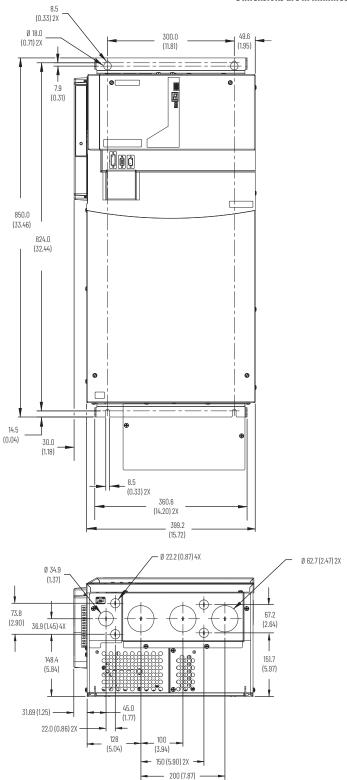

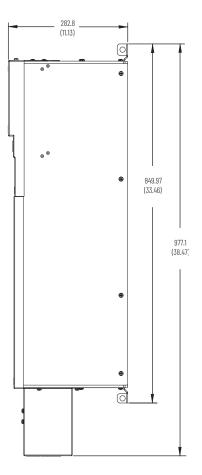

Figure 72 - 2099-BM11-S and 2099-BM12-S Approximate Dimensions

#### Dimensions are in millimeters (inches)

**Important:** Additional clearance below the connector is necessary to provide the recommended cable bend radius.

# **Interconnect Diagrams**

This appendix provides wiring examples and system block diagrams to assist you in wiring your Kinetix  $^{\circ}$  7000 system components.

# **Interconnect Diagram Notes**

The notes below apply to the Kinetix 7000 drive wiring examples on the following pages.

| Note | e Information   |  |  |  |  |
|------|---|--|--|--|--|
| 1    | For power wiring specifications, refer to Power Wiring Requirements on page <u>84</u> .   |  |  |  |  |
| 2    | For input fuse and circuit breaker sizes, refer to Circuit Breaker/Fuse Specifications on page 151 and 148.   |  |  |  |  |
| 3    | Place AC (EMC) line filters as close to the drive as possible and do not route very dirty wires in wireway. If routing in wireway is unavoidable, use shielded cable with shields grounded to the drive chassis and filter case. For line filter specifications, refer to the AC Line Filter Specifications on page 155. See Establish Noise Zones on page 28 for wire routing guidelines.  |  |  |  |  |
| 4    | Contactor coil (M1) needs integrated surge suppressors for AC coil operation. Refer to the Contactor Ratings on page 152 for more information.  |  |  |  |  |
| 5    | The default configuration for the ground jumper is for grounded power at the customer site. Ungrounded, impedance grounded, high resistive grounded, B phase grounded, or common DC bus power distribution system sites must disconnect the protective MOVs and Common Mode Capacitors to guard against unstable operation and/or drive damage. Refer to Determine the Input Power Configuration on page 73 for more information. |  |  |  |  |
| 6    |   |  |  |  |  |
|      | <b>ATTENTION:</b> Implementation of safety circuits and risk assessment is the responsibility of the machine builder. Please reference international standards EN 1050 and EN 954 estimation and safety performance categories. For more information, refer to Understanding the Machinery Directive, publication SHB-900.  |  |  |  |  |
| 7    | Use of an external 24V DC control power supply is recommended for energizing the main control board. This allows the Sercos ring to remain active when main power is removed. The main control board is powered from the DC bus during drive operation and can be used in this manner, if necessary.  |  |  |  |  |
| 8    | The General Purpose Relay outputs on the Kinetix 7000 drive are configured as follows: GPR1+ and GRP1- have noise suppression circuitry and should be used for the motor brake, if used. The default setting for GPR2+ and GPR2- is DROK or Drive_OK. The GPR2 contacts close when external 24V DC control power is applied to the Control Power terminals and there are no shutdown faults.                                      |  |  |  |  |
| 9    | External AC input power for the cooling fan is required only for 2099-BM09-S, 2099-BM10-S, 2099-BM11-S, and 2099-BM12-S drives. The cooling fans on 2099-BM06-S, 2099-BM07-S, and 2099-BM08-S drives are powered internally.  |  |  |  |  |
| 10   | Dual 8720MC-RPSxxx units use a ribbon cable to connect the master unit to the slave unit control. The ribbon cable is included with the slave unit.   |  |  |  |  |
| 11   | Contact for use with a safety circuit or other system requirement.  |  |  |  |  |

### **Kinetix 7000 Drive/Rotary Motor Wiring Examples**

**IMPORTANT** 

The Kinetix MPL motor wiring example on this page applies to motors equipped with bayonet connectors.

Figure 82 - Kinetix MPL Motors (Bayonet Style Connector)

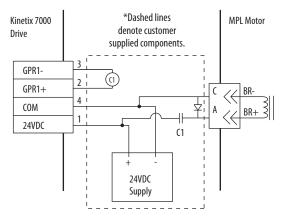

- (1) See <u>Customer-supplied 24V DC Power Supply Notes on page 173</u> for important wiring information.
- (2) See <u>Kinetix MPL Motor Connectors on page 82</u> for more information on bayonet and circular DIN connectors.
- (3) See Wire Low-profile Connectors on page 97 for more information on grounding feedback cables when using low-profile connectors.

#### Customer-supplied 24V DC Power Supply Notes

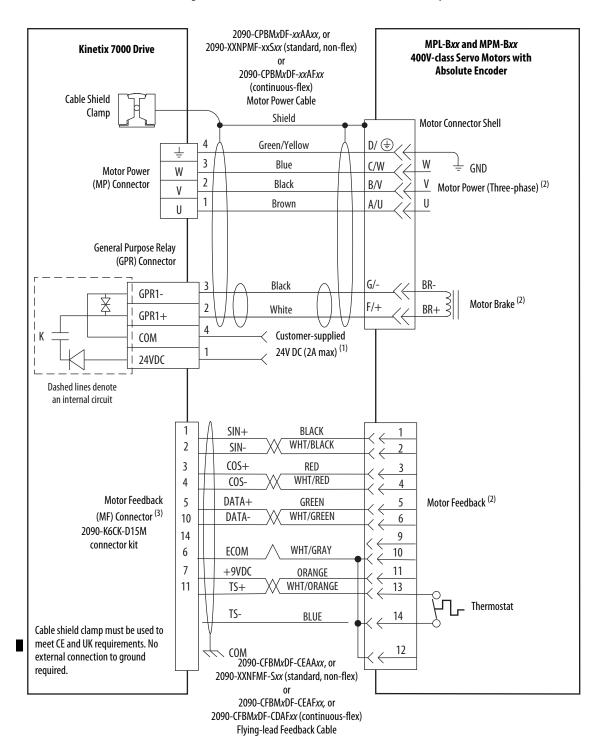

- The contact connected to GPR1+ and GPR1- is rated 2 Amps inductive @ 250V AC/30V DC maximum.
- Kinetix MPx motors with a brake have various coil current requirements.
   Refer to the Kinetix 7000 Design Guide, publication <u>KNX-RM007</u> for coil current requirements.
- For motors that utilize above 2 Amp coil current it is recommended that a customer-supplied external device, such as an interposing relay, be used between the drive and motor. See Figure 83 below.
- A customer-supplied diode or metal oxide varistor (MOV) is recommended for use with an interposing relay to prevent an electrical arc that may occur before the brake coil power dissipates. Use of an MOV can also reduce the amount of time required to mechanically engage the brake. See <u>Figure 83</u> below.

Figure 83 - Customer-supplied 24V DC Power Supply Wiring Example

**IMPORTANT** The Kinetix MPL motor wiring example on this page applies to motors equipped with circular DIN connectors.

Figure 84 - Kinetix MPL and MPM Motors (Circular DIN Style Connector)

<sup>(1)</sup> See <u>Customer-supplied 24V DC Power Supply Notes on page 173</u> for important wiring information.

<sup>(2)</sup> See Kinetix MPL Motor Connectors on page 82 for more information on bayonet and circular DIN connectors.

<sup>(3)</sup> See Wire Low-profile Connectors on page 97 for more information on grounding feedback cables when using low-profile connectors.

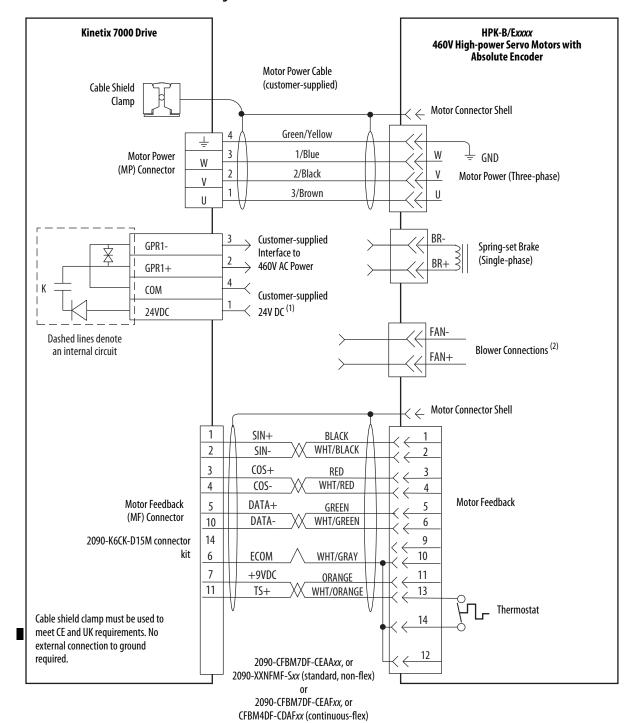

Figure 85 - Kinetix HPK Motors

<sup>(1)</sup> See <u>Customer-supplied 24V DC Power Supply Notes (Kinetix HPK motors) on page 176</u> for important wiring information.

<sup>(2)</sup> See <u>Kinetix HPK Motor Blower Connections on page 176</u> for more information.

#### Customer-supplied 24V DC Power Supply Notes (Kinetix HPK motors)

- Kinetix HPK motors require a customer-supplied 460V AC single-phase supply, rather than a 24V DC supply. However, the brake current ratings required by Kinetix HPK motors are higher than the contact rating of the GPR connector. Therefore, if using an Kinetix HPK motor with a brake, it is recommended that a customer-supplied, external interposing relay or equivalent circuit be used. See Figure 86 below.
- The contact connected to GPR1+ and GPR1- is rated 2 Amps inductive
   @ 250V AC/30 VDC maximum.
- See the Kinetix Motion Control Selection Guide, publication <u>KNX-SG001</u> for Kinetix HPK motor brake ratings.

#### Kinetix HPK Motor Blower Connections

• The Kinetix HPK motor blower must be used to ensure proper motor performance.

460V AC

Supply

- The blower connections can use either a Star (460 V AC) or Delta (230V AC) three-phase configuration. See the Kinetix HPK Asynchronous Servo Motor Installation Instructions, publication <u>HPK-IN001</u>, for connection diagrams.
- Kinetix HPK Motors with a brake and without a brake have different blower assemblies and, therefore, have different connection and electrical characteristics.
- The Kinetix HPK motor has a conduit box with terminals/leads for external power connections.
- See the Kinetix Motion Control Selection Guide, publication <u>KNX-SG001</u> for Kinetix HPK motors blower voltage and current specifications.

#### Customer-supplied 24V DC Power Supply Notes (Kinetix MMA motors)

- Kinetix MMA brakes may require a customer-supplied 400... 480V AC single-phase supply, rather than a 24V DC supply. However, the brake current ratings required by Kinetix MMA motors are higher than the contact rating of the GPR connector. Therefore, if using an Kinetix MMA motor with a brake, it is recommended that a customer-supplied, external interposing relay or equivalent circuit be used. See Figure 88 below.
- The contact connected to GPR1+ and GPR1- is rated 2 Amps inductive
   250V AC/30V DC maximum.
- See the Kinetix Motion Control Selection Guide, publication <u>KNX-SG001</u> for Kinetix MMA motor brake ratings.

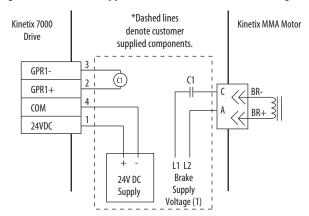

Figure 88 - Customer-supplied Kinetix MMA Motor Brake Wiring Example

(1) Brake power supply voltage will depend on the motor catalog selection. The voltage with either be 24V DC or 400V-class AC.

#### Kinetix MMA Motor Blower Connections

- The radial blower connection comes from the factory wired as a star (400...480V) three-phase configuration. A customer can choose to rewire to the delta 230V 3-phase configuration. The star and delta connection and motor ratings can be found on the motor name plate. See the Kinetix MMA Asynchronous Servo Motor Installation Instructions, publication MM-IN001, for connection diagrams. It is not recommended to change the wiring configuration for your blower motor.
- See the Kinetix Motion Control Selection Guide, publication <u>KNX-SG001</u> for Kinetix MMA motors blower voltage and current specifications.
- The Kinetix MMA motor blower must be used to ensure proper motor performance. A separate blower terminal box is provided to connect external power to the blower. See <u>Table 69</u> for additional information.

# **Upgrade Firmware**

This appendix provides procedures for using the ControlFLASH™ utility to upgrade the firmware in a Kinetix® 7000 drive.

| Торіс            | Page |
|------------------|------|
| Before You Begin | 183  |
| Upgrade Firmware | 184  |

### **Before You Begin**

Upgrading the firmware of a Kinetix 7000 servo drive using the ControlFLASH utility involves entering the name of the target device, locating the Sercos interface module and Kinetix 7000 servo drive to be flashed, finding the existing new firmware levels, and flashing the drive firmware.

Before you begin this procedure, make sure you have the following.

| Description  | Catalog Numbers     | Version          |
|--|---------------------|------------------|
| RSLogix 5000® Software                                 | 9324-RLD300NE       | 15.0 or later    |
| RSLinx® Software                                       | 0355-RSLETENE       | 2.50.00 or later |
| ControlFLASH Kit                                       | N/A                 | 4.00.09 or later |
| Firmware for Logix Sercos interface module or PCI card | 1756-M <i>xx</i> SE | 15.32 or later   |
|  | 1756-L60M03SE       | 15.4 or later    |
|  | 1768-M04SE          | 15.35 or later   |
|  | 1784-PM16SE         | 15.33 or later   |
| Firmware upgrade file for Kinetix 7000                 | (1),(2)             | •                |

<sup>(1)</sup> Contact Rockwell Automation Technical Support at (440) 646-5800 for firmware upgrade files and assistance.

<sup>(2)</sup> Go to <u>rok.auto/support</u> for firmware upgrades.

### **Upgrade Firmware**

This procedure requires you to use ControlFLASH software to upgrade the firmware in a Kinetix 7000 drive.

1. Verify 24V DC control power is supplied to the Kinetix 7000 drive requiring firmware upgrade.

#### **IMPORTANT**

The seven segment LED on the Kinetix 7000 must display a 2, 3, or 4 before beginning this procedure. Only these displays indicates the drive has been recognized by the Sercos interface.

**ATTENTION:** To avoid injury or damage to equipment due to unpredictable motor activity, do not apply main input power to the drive, or source drive power from a DC common bus.

**2.** Open your ControlFLASH software or select the ControlFLASH utility from the Tools menu of RSLogix 5000 software.

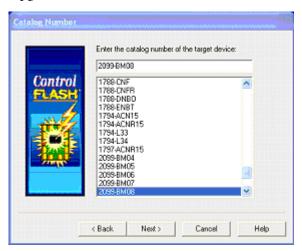

The Welcome to ControlFLASH dialog opens.

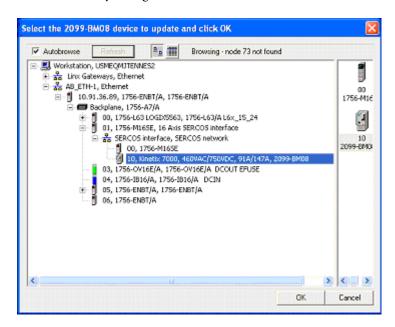

3. Click Next.

The Catalog Number dialog opens.

**4.** Select the catalog number of the Kinetix 7000 (2099-BMxx-S) drive to upgrade.

- 5. Click Next.
- **6.** Select the Sercos interface module and Kinetix 7000 drive to flash in the RSLinx Gateway dialog.

7. Click OK.

Control
Contro

**8.** Select the firmware revision to use in this update.

Select the new firmware from the list, or browse for it using the Current Folder option.

- 9. Click Next.
- **10.** Confirm the catalog number and serial number of the drive, and its current revision and new revision of firmware.

11. Click Finish.

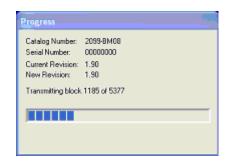

12. Click Yes to confirm updating of the target device.

13. Click OK to acknowledge the Motion Stop notice.

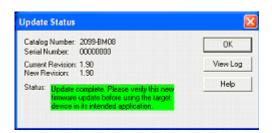

A dialog will display the progress of the flash update.

While this display is active, the Status display on the drive will display an F.

The Update Status dialog indicates success or failure as described below.

| Flashing  | If  |
|-----------|---|
| Succeeded | <ul><li>5. Update complete appears in a GREEN status dialog.</li><li>6. Go to Step 2.</li></ul> |
| Failed    | Update failure appears in a RED status dialog.     Contact Technical Support.                   |

#### 14. Click OK.

The ControlFLASH software returns to the Welcome screen where you can flash another drive or select Cancel to exit the program.

## **Rockwell Automation Support**

Use these resources to access support information.

| Technical Support Center                         | Find help with how-to videos, FAQs, chat, user forums, Knowledgebase, and product notification updates. | rok.auto/support           |
|--|---|----------------------------|
| Local Technical Support Phone Numbers            | Locate the telephone number for your country.   | rok.auto/phonesupport      |
| Technical Documentation Center                   | Quickly access and download technical specifications, installation instructions, and user manuals.      | rok.auto/techdocs          |
| Literature Library                               | Find installation instructions, manuals, brochures, and technical data publications.                    | <u>rok.auto/literature</u> |
| Product Compatibility and Download Center (PCDC) | Download firmware, associated files (such as AOP, EDS, and DTM), and access product release notes.      | rok.auto/pcdc              |

### **Documentation Feedback**

Your comments help us serve your documentation needs better. If you have any suggestions on how to improve our content, complete the form at rok.auto/docfeedback.

## **Waste Electrical and Electronic Equipment (WEEE)**

At the end of life, this equipment should be collected separately from any unsorted municipal waste.

Rockwell Automation maintains current product environmental compliance information on its website at rok.auto/pec.
