PowerFlex 750-Series Safe Torque Off Option Module

Catalog Number 20-750-S
Important User Information

Read this document and the documents listed in the additional resources section about installation, configuration, and operation of this equipment before you install, configure, operate, or maintain this product. Users are required to familiarize themselves with installation and wiring instructions in addition to requirements of all applicable codes, laws, and standards.

Activities including installation, adjustments, putting into service, use, assembly, disassembly, and maintenance are required to be carried out by suitably trained personnel in accordance with applicable code of practice.

If this equipment is used in a manner not specified by the manufacturer, the protection provided by the equipment may be impaired.

In no event will Rockwell Automation, Inc. be responsible or liable for indirect or consequential damages resulting from the use or application of this equipment.

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variables and requirements associated with any particular installation, Rockwell Automation, Inc. cannot assume responsibility or liability for actual use based on the examples and diagrams.

No patent liability is assumed by Rockwell Automation, Inc. with respect to use of information, circuits, equipment, or software described in this manual.

Reproduction of the contents of this manual, in whole or in part, without written permission of Rockwell Automation, Inc., is prohibited.

Throughout this manual, when necessary, we use notes to make you aware of safety considerations.

---

**WARNING:** Identifies information about practices or circumstances that can cause an explosion in a hazardous environment, which may lead to personal injury or death, property damage, or economic loss.

**ATTENTION:** Identifies information about practices or circumstances that can lead to personal injury or death, property damage, or economic loss. Attentions help you identify a hazard, avoid a hazard, and recognize the consequence.

**IMPORTANT** Identifies information that is critical for successful application and understanding of the product.

---

Labels may also be on or inside the equipment to provide specific precautions.

**SHOCK HAZARD:** Labels may be on or inside the equipment, for example, a drive or motor, to alert people that dangerous voltage may be present.

**BURN HAZARD:** Labels may be on or inside the equipment, for example, a drive or motor, to alert people that surfaces may reach dangerous temperatures.

**ARC FLASH HAZARD:** Labels may be on or inside the equipment, for example, a motor control center, to alert people to potential Arc Flash. Arc Flash will cause severe injury or death. Wear proper Personal Protective Equipment (PPE). Follow ALL Regulatory requirements for safe work practices and for Personal Protective Equipment (PPE).

## Index
.............................................................. 35
This manual explains how PowerFlex® 750-Series Safe Torque Off option module can be used in Safety Integrity Level (SIL) 3, Performance Level [PLe], or Category (cat.) 3 applications. It describes the safety requirements, including PFD and PFH values and application verification information, and provides information on installing, configuring, and troubleshooting the Safe Torque Off option module.

Use this manual if you are responsible for designing, installing, configuring, or troubleshooting safety applications that use the PowerFlex 750-Series Safe Torque Off option module.

The 20-750-S Safe Torque Off option module applies to the following PowerFlex 750-Series drives:

- PowerFlex 755TL low harmonic, non-regenerative drives
- PowerFlex 755TR regenerative drives
- PowerFlex 755TM drive systems with regenerative bus-supplies and common-bus inverters
- PowerFlex 755 AC drives
- PowerFlex 753 AC drives

Throughout this manual, PowerFlex 755T drive products is used to refer to PowerFlex 755TL drives, PowerFlex 755TR drives, and PowerFlex 755TM drive systems.

We recommend that you have a basic understanding of the electrical circuitry and familiarity with these products. You must also be trained and experienced in the creation, operation, and maintenance of safety systems.

Summary of Changes

This manual contains new and updated information as indicated in the following table.

<table>
<thead>
<tr>
<th>Topic</th>
<th>Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>Added definitions for DCavg%, and MTTFₚ to the Terminology table.</td>
<td>6</td>
</tr>
<tr>
<td>Updated the definitions of PELV, PFH, and SELV in the Terminology table.</td>
<td>6</td>
</tr>
<tr>
<td>Added the PowerFlex 750-Series AC Drives Technical Data publication to the Additional Resources table.</td>
<td>8</td>
</tr>
<tr>
<td>Updated the definition of PFH in PFD and PFH Definitions section.</td>
<td>12</td>
</tr>
<tr>
<td>Changed the PFD and PFH data section to Safety Data section.</td>
<td>12</td>
</tr>
<tr>
<td>Added IMPORTANT statement to Safety Data section for determination of safety parameters.</td>
<td>12</td>
</tr>
<tr>
<td>Added rows for MTTFₚ years and DCavg% data to PFD and PFH for PowerFlex 753 and PowerFlex 755 Drives table and PFD and PFH for PowerFlex 755T Drive Products table.</td>
<td>12, 13</td>
</tr>
<tr>
<td>Added columns for Drive Frames 5 and 6, Drive Frames 7 and 8, Drive Frame 13, Drive Frame 14, and Drive Frame 15 to PFD and PFH for PowerFlex 755T Drive Products table.</td>
<td>13</td>
</tr>
<tr>
<td>Updated the list of supported drive families in the Safety Reaction Time table.</td>
<td>13</td>
</tr>
<tr>
<td>Updated the Remove Power to the System section in the Installation and Wiring chapter.</td>
<td>16</td>
</tr>
</tbody>
</table>
Conventions

In this manual, we list configuration parameters by number followed by the name in brackets. For example, P24 [OverSpd Response].

Terminology

This table defines abbreviations that are used in this manual.

<table>
<thead>
<tr>
<th>Abbreviation</th>
<th>Full Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>1oo2</td>
<td>One out of Two</td>
<td>Refers to the behavioral design of a dual-channel safety system.</td>
</tr>
<tr>
<td>cat.</td>
<td>Category</td>
<td>Classification of the safety-related parts of a control system in respect of their resistance to faults and their subsequent behavior in the fault condition, and which is achieved by the structural arrangement of the parts, fault detection, and/or by their reliability (source EN ISO 13849-1).</td>
</tr>
<tr>
<td>CL</td>
<td>Claim Limit</td>
<td>The maximum SIL rating that can be claimed for a Safety-Related Electrical Control System subsystem in relation to architectural constraints and systematic safety integrity (source IEC 62061).</td>
</tr>
<tr>
<td>DCavg%</td>
<td>Diagnostic Coverage</td>
<td>Ratio between the failure rate of detected dangerous failures and the failure rate of total dangerous failures. (source IEC 61508).</td>
</tr>
<tr>
<td>EN</td>
<td>European Norm</td>
<td>The official European Standard.</td>
</tr>
<tr>

<td>Emergency Shutdown Systems</td>
<td>A system, usually independent of the main control system, that is designed to shut down an operating system safely.</td>
</tr>
<tr>
<td>HFT</td>
<td>Hardware Fault Tolerance</td>
<td>The HFT equals $n$, where $n+1$ faults could cause the loss of the safety function. An HFT of 1 means that 2 faults are required before safety is lost.</td>
</tr>
<tr>
<td>HIM</td>
<td>Human Interface Module</td>
<td>A module used to configure a device.</td>
</tr>
<tr>
<td>IEC</td>
<td>International Electrotechnical Commission</td>
<td>The International Electrotechnical Commission (IEC) is the world's leading organization that prepares and publishes International Standards for all electrical, electronic, and related technologies.</td>
</tr>
<tr>
<td>IGBT</td>
<td>Insulated Gate Bi-polar Transistors</td>
<td>Typical power switch used to control main current.</td>
</tr>
<tr>
<td>ISO</td>
<td>International Organization for Standardization</td>
<td>The International Organization for Standardization is an international standard-setting body that is composed of representatives from various national standards organizations.</td>
</tr>
<tr>
<td>MTTFD</td>
<td>Mean Time to Failure</td>
<td>The average length of time before a device has a dangerous failure.</td>
</tr>
<tr>
<td>PELV</td>
<td>Protective Extra Low Voltage</td>
<td>An electrical system where the voltage cannot exceed ELV under normal conditions, and under single-fault conditions, except earth faults in other circuits. PELV is defined in IEC 61131-2.</td>
</tr>
<tr>
<td>PFD</td>
<td>Probability of Dangerous Failure on Demand</td>
<td>The average probability of a system to fail to perform its design function on demand.</td>
</tr>
<tr>
<td>PFH</td>
<td>Average Frequency of a Dangerous Failure per Hour</td>
<td>The average frequency of a system to have a dangerous failure occur per hour.</td>
</tr>
<tr>
<td>PL</td>
<td>Performance Level</td>
<td>EN ISO 13849-1 safety rating</td>
</tr>
</tbody>
</table>
## Abbreviation | Full Term | Definition
--- | --- | ---
SELV | Safety Extra Low Voltage Circuit | A secondary circuit that is designed and protected so that, under normal and single fault conditions, its voltages do not exceed a safe value. SELV is defined in IEC 61010-2-201.
SIL | Safety Integrity Level | A measure of a product's ability to lower the risk that a dangerous failure could occur.
STO | Safe Torque Off | The Safe Torque Off (STO) function is used to prevent unexpected motor rotation if there is an emergency while the drive remains connected to the power supply. When STO is activated, the torque power cannot reach the drive, thus stopping and preventing any motor shaft rotation.
## Additional Resources

These documents contain additional information concerning related Rockwell Automation products.

Certification

The PowerFlex 750-Series Safe Torque Off option module is certified for use in safety applications up to and including SIL 3 according to EN/IEC 61800-5-2, IEC 61508, and SIL CL3 according to EN 62061, Performance Level PLe, and Category 3 according to EN ISO 13849-1. Safety requirements are based on the standards current at the time of certification.

The TÜV Rheinland group has approved the PowerFlex 750-Series Safe Torque Off option module for use in safety-related applications where the de-energized state is considered to be the safe state. The examples in this manual are based on achieving de-energization as the safe state for typical Machine Safety and Emergency Shutdown (ESD) systems.
Important Safety Considerations

The system user is responsible for the following:

- Set-up, safety rating, and validation of any sensors or actuators connected to the system
- Complete system-level risk assessment and reassess the system any time a change is made
- Certification of the system to the desired safety Performance Level
- Project management and proof testing
- Program the application software and the safety option module configurations in accordance with the information in this manual
- Access control to the system
- Analyze all configuration settings and choose the proper setting to achieve the required safety rating

**IMPORTANT** When applying Safety, restrict access to qualified, authorized personnel who are trained and experienced.

**ATTENTION:** When designing your system, consider how personnel exit the machine if the door locks while they are in the machine. Additional safeguarding devices may be required for your specific application.

Safety Category 3 Performance Definition

To achieve Safety Category 3, according to EN ISO 13849-1, design the safety-related parts according to these guidelines:

- The safety-related parts of machine control systems and/or their protective equipment, and their components, shall be designed, constructed, selected, assembled, and combined in accordance with relevant standards so that they can withstand expected conditions
- Basic safety principles shall be applied
- A single fault in any of its parts does not lead to a loss of safety function.
- The average diagnostic coverage of the safety-related parts of the control system shall be medium
- The mean-time to dangerous failure of each of the redundant channels shall be high
- Measures against common cause failure shall be applied
Stop Category Definitions

Conduct a risk assessment to determine the selection of a stop category for each stop function.

- Stop Category 0 is achieved with immediate removal of power to the actuator. This results in an uncontrolled coast-to-stop. Safe Torque Off accomplishes a Stop Category 0 stop.
- Stop Category 1 is achieved with power available to the machine actuators to achieve the stop. Power is removed from the actuators when the stop is achieved.

**Performance Level and Safety Integrity Level (SIL) 3**

For safety-related control systems, Performance Level (PL), according to EN ISO 13849-1, and SIL levels, according to IEC 61508 and EN 62061, include a rating of the ability of the system to perform its safety functions. All safety-related components of the control system must be included in both a risk assessment and the determination of the achieved levels.

See the EN ISO 13849-1, IEC 61508, and EN 62061 standards for complete information on requirements for PL and SIL determination.

**Proof Tests**

The safety standards require that proof tests be performed on the equipment that is used in the system. Proof tests are performed at user-defined intervals and are dependent upon PFD and PFH values.

**IMPORTANT** Your specific application determines the time frame for the proof test interval.

Verify operation of safety function after drive installation, modification, or maintenance. See **Verify Operation** on page 21 for more information.
PFD and PFH Definitions

Safety-related systems can be classified as operating in either a Low Demand mode, or in a High Demand/Continuous mode.

- Low Demand mode: where the frequency of demands for operation that are made on a safety-related system is no greater than one per year or no greater than twice the proof test frequency.
- High Demand/Continuous mode: where the frequency of demands for operation that are made on a safety-related system is greater than once per year or greater than twice the proof test interval.

The SIL value for a low-demand safety-related system is directly related to order-of-magnitude ranges of its average probability of failure to perform its safety function satisfactorily on demand or, simply, average probability of a dangerous failure on demand (PFD). The SIL value for a High Demand/continuous mode safety-related system is directly related to the average frequency of a dangerous failure occurring per hour (PFH).

Safety Data

PFD and PFH calculations are based on the equations from Part 6 of IEC 61508.

These tables provide data for a 20-year proof test interval and demonstrate the worst-case effect of various configuration changes on the data.

IMPORTANT Determination of safety parameters is based on the assumptions that the system operates in High-demand mode and that the safety function is requested at least once every year.

Safe State

The safe state encompasses all operation that occurs outside of the other monitoring and stopping behavior that is defined as part of the Safe Torque Off option module.

If a Safe State fault is detected, the safety option module transitions to the safe state. This includes faults that are related to the integrity of hardware or firmware. The drive safe state is defined as preventing force-producing power from being provided to the motor. For more information on the safe state, see EN/IEC 61800-5-2.

**IMPORTANT**

The drive is in the safe state if the safety function is installed and the drive status is ‘Not Enabled’. Drive ‘Ready’ is NOT a safe state even if there is no motion.

**ATTENTION:** In circumstances where external influences (for example, falling of suspended loads) are present, additional measures (for example, mechanical brakes) can be necessary to help prevent a hazard.

Safety Reaction Time

The safety reaction time is the length of time from a safety-related event as input to the system until the system is in the safe state.

The safety reaction time from an input signal condition that triggers a safe stop, to the initiation of the configured Stop Type, is shown in Table 3.
### Considerations for Safety Ratings

The achievable safety rating of an application using the safety option module installed in PowerFlex 750-Series drives is dependent upon many factors, drive options, and the type of motor.

For applications that rely on the immediate removal of power to the actuator, which results in an uncontrolled coast-to-stop, a safety rating up to and including SIL 3, PLe, and Category 3 can be achieved.

### Contact Information if Safety Option Failure Occurs

If you experience a failure with any safety-certified device, contact your local Allen-Bradley distributor. With this contact, you can do the following:

- Return the device to Rockwell Automation so the failure is appropriately logged for the catalog number that is affected and a record is made of the failure.
- Request a failure analysis (if necessary) to determine the probable cause of the failure.

---

**Table 3 - Safety Reaction Time**

<table>
<thead>
<tr>
<th>Drive Family</th>
<th>Value, Max</th>
</tr>
</thead>
<tbody>
<tr>
<td>PowerFlex 753 drives, Frames 1…7</td>
<td>10 ms</td>
</tr>
<tr>
<td>PowerFlex 755 drives, Frames 1…10</td>
<td>10 ms</td>
</tr>
<tr>
<td>PowerFlex 755TL drives, PowerFlex 755TR drives, and PowerFlex 755TM drive systems, Frames 7…15</td>
<td>10 ms</td>
</tr>
<tr>
<td>PowerFlex 755TL drives, Frames 5, 6</td>
<td>20 ms</td>
</tr>
</tbody>
</table>

**IMPORTANT** An input signal condition that is present for less than the reaction time cannot result in the safety function being performed. Repeated requests of the safety function for less than the reaction time can result in a spurious detection of a fault.

</table>

**ATTENTION:** The following information is merely a guide for proper installation. Rockwell Automation cannot assume responsibility for the compliance or the noncompliance to any code, national, local or otherwise for the proper installation of this equipment. A hazard of personal injury and/or equipment damage exists if codes are ignored during installation.

**IMPORTANT** Installation must be in accordance with the instructions in this user manual and the installation instructions for your drive. Only qualified, authorized personnel that are trained and experienced in safety can plan, implement, and apply safety systems.

**IMPORTANT** During installation and maintenance, check your drive firmware release notes for known anomalies and verify that there are no safety-related anomalies.

The PowerFlex 750-Series Safe Torque Off option module is intended to be part of the safety-related control system. Before installation, perform a risk assessment that compares the PowerFlex 750-Series Safe Torque Off option module specifications and all foreseeable operational and environmental characteristics of the control system.

A safety analysis of the machine section that is controlled by the drive is required to determine how often to test the safety function for proper operation during the life of the machine.
Chapter 2  Installation and Wiring

Remove Power to the System

Before performing any work on this drive, remove all power to the system.

ATTENTION:
- Electrical Shock Hazard. Verify that all sources of AC and DC power are de-energized and locked out or tagged out in accordance with the requirements of ANSI/NFPA 70E, Part II.
- To avoid an electric shock hazard, verify that the voltage on the bus capacitors has discharged before performing any work on the drive. Measure the DC bus voltage at the +DC and -DC terminals or test points. The voltage must be zero.

For the location of the terminal block and test point sockets, see the manual for your drive:
- PowerFlex 750-Series AC Drives Installation Instructions, publication 750-IN001.
- PowerFlex 750-Series Products with TotalFORCE Control Installation Instructions, publication 750-IN100.
- PowerFlex 755TM IP00 Open Type Kits Installation Instructions, publication 750-IN101.
- In Safe Torque Off mode, hazardous voltages may still be present at the motor. To avoid an electric shock hazard, disconnect power to the motor and verify that the voltage is zero before performing any work on the motor.

Access the Control Pod

The option module is installed in the drive control pod. Different drives have different ways to access the control pod.

To access the control pod, follow these steps.
1. Open the door or remove cover.
2. Loosen the retention screw on the HIM cradle.
3. Lift the cradle until the latch engages.

See the installation instructions for your drive for more information.
Set the Safety Enable Jumper

The PowerFlex 750-Series drives ship with the safety-enable (SAFETY) jumper installed. The jumper, which is on the main control board, must be removed when using the Safe Torque Off option module or a Safety Jumper In fault (F213) occurs.

**IMPORTANT** Failure to remove the SAFETY jumper causes the drive to fault when a start command is issued.

**Figure 2 - PowerFlex 753 Drive Jumper Locations**

PowerFlex 755 drives (frames 8, 9, and 10) do not have a safety enable jumper.
Install the Safety Option Module

To install the Safe Torque Off option module:

1. Firmly press the module edge connector into the desired port.

   **IMPORTANT** The Safe Torque Off option module can be installed in any drive port. However, when used in an integrated motion application, the module must be installed in port 6.

   **IMPORTANT** Only one safety option module can be installed at a time. Installing multiple or duplicate safety option modules is not supported.

2. Tighten the top and bottom retaining screws.
   - Recommended torque = 0.45 N•m (4.0 lb•in)
   - Recommended screwdriver = T15 Hexalobular

   **IMPORTANT** Do not overtighten retaining screws.
Wire the Safety Option Module

Observe these wiring guidelines when installing the safety option module:

- Use copper wire with an insulation rating of 600V or greater is recommended.
- Separate control wires from power wires by at least 0.3 m (1 ft).

Safety Input Connection Example

Dedicated Power Supply
Cabling

Safety input wiring must be protected against external damage by cable ducting, conduit, armored cable, or other means.

Shielded cable is required. For proper shield termination, follow the installation requirements that are related to EN 61800-3 and the EMC Directive as described in these publications:

- PowerFlex 750-Series AC Drive Installation Instructions, publication 750-IN001
- PowerFlex 750-Series Products with TotalFORCE Control Installation Instructions, publication 750-IN100

Power Supply Requirements

The external power supply must conform to the Directive 2014/35/EU Low Voltage, by applying the requirements of EN61131-2 Programmable Controllers, Part 2 - Equipment Requirements and Tests and one of the following:

- EN60950 - SELV (Safety Extra Low Voltage)
- EN60204 - PELV (Protective Extra Low Voltage)
- IEC 60536 Safety Class III (SELV or PELV)
- UL 508 Limited Voltage Circuit
- 24V DC ±10% must be supplied by a power supply that complies with IEC 60204 and IEC 61558-1.

For specific power supply recommendations, refer to your drive installation instructions:

- PowerFlex 750-Series Products with TotalFORCE Control Installation Instructions, publication 750-IN100.
- PowerFlex 750-Series AC Drives Installation Instructions, publication 750-IN001.

For planning information, see the guidelines in Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1.

Verify Operation

Test the safety function for proper operation after initial installation of the safety option module. Retest the safety function at the intervals that are determined by the safety analysis that is described on page 15.

Verify that both safety channels are functioning according to Table 6.

</tbody>
</table>

**IMPORTANT**  
If an external fault is present on the wiring or circuitry controlling the Safety Enable or Safety Power inputs for a period of time, the safety option module does not detect this condition. When the external fault condition is removed, the safety option module allows an enable condition.

To achieve maximum safety rating, both safety inputs SP and SE must be activated by appropriate dual-channel equipment. The repeated activation of the safety function by only one input at a time can result in a spurious detection of a fault.

**TIP**  
There is no safe-status output provided on the safety option module.
Safe Torque Off Option Module Operation

This chapter provides operation and Stop Category example wiring diagrams for the PowerFlex® 750-Series Safe Torque Off option module.

<table>
<thead>
<tr>
<th>Topic</th>
<th>Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operation</td>
<td>23</td>
</tr>
<tr>
<td>Stop Category Wiring Examples</td>
<td>24</td>
</tr>
</tbody>
</table>

**Operation**

The PowerFlex 750-Series Safe Torque Off option module (see Figure 5) disables the drive’s output IGBTs by disconnecting power to the gate control driver IC, or disabling the output of the gate-control driver IC. This helps prevent the drive’s output power devices from switching in the pattern necessary to generate AC power to the motor.

The safety option module can be used in combination with other safety devices to satisfy the requirements of IEC 61508, EN/IEC 61800-5-2 SIL 3, EN ISO 13849-1 PLe, and Category 3 for Safe Torque Off (STO).

**IMPORTANT**

The safety option module is suitable for performing mechanical work on the drive system or affected area of a machine only. It does not provide electrical safety.

Do not use the safety option module as a control for starting and/or stopping the drive.

**IMPORTANT**

The safety option module does not eliminate dangerous voltages at the drive output. Input power to the drive must be turned off and safety procedures followed before performing any electrical work on the drive or motor. See Remove Power to the System on page 16 for more information.

**ATTENTION:** In the event of the failure of two output IGBTs in the drive, when the safety option module has controlled the drive outputs to the OFF state, the drive can provide energy for up to 180° of rotation in a 2-pole motor before torque production in the motor ceases.

Under normal operation, 24V DC is applied to both the Safety Power and Safety Enable inputs of the safety option module. If the Safety Enable or Safety
Power is de-energized, the outputs of the gate-control driver IC are disabled and IGBT firing is disabled. On the PowerFlex 753/755, parameter 933 [Start Inhibits] indicates that IGBTs are inhibited and the HIM indicates that the drive is not enabled. On the PowerFlex 755T, this is indicated in parameter 10:351 [M Start Inhibits].

**ATTENTION:** By itself, the safety option module initiates a coast-to-stop action. Additional protective measures must be applied when an application requires a different stopping action.

The following diagrams illustrate Stop Category 0 and Stop Category 1 dual-channel wiring examples for PowerFlex 750-Series drives with Guardmaster safety relays. Examples include the following drive families:
- PowerFlex 753 and PowerFlex 755 Drives, Frames 1...10
- PowerFlex 755T Drive Products, Frames 5...12, 13, 14, and 15

Table 10 - POINT Guard I/O Example Summary

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Circuit status</td>
<td>Circuit is shown with guard door closed and system ready for normal drive operation.</td>
</tr>
<tr>
<td>Operating principle</td>
<td>When a partial-access guard door is opened, the safety system initiates and maintains a stop command to stop hazardous motion before a person can reach the hazardous area. The safety system cannot be reset, and hazardous motion cannot be restarted while the guard door is open. Once the guard door is closed and the stop command is reset, a valid start command is required before hazardous motion can resume.</td>
</tr>
<tr>
<td>Fault detection</td>
<td>The GuardLogix® controller-logic monitors the system for valid status and faults. When it receives a safety demand on its inputs or an invalid status or fault is detected, the GuardLogix controller-logic deactivates its safety outputs and sends a safety stop command. The PowerFlex drive monitors its internal safety circuits for valid status and faults. When the GuardLogix controller de-energizes the drive Safe Torque Off (STO) inputs, or an invalid state or fault is detected, the STO feature on the drive forces the drive output power transistors to a disabled state. The hazardous motion that is controlled by the drive coasts or ramps to a stop. This feature does not provide electrical power isolation.</td>
</tr>

---

(1) See Industrial Automation Wiring and Grounding Guidelines, publication 1770-4.1.
(2) Safety outputs need additional fuse for reverse voltage protection of the control circuit. Install a 6 A slow-blow or 10 A fast-acting fuse.

ATTENTION: Failure to maintain the specified ambient temperature can result in a failure of the safety function.

IMPORTANT: Products with a safety function installed must be protected against conductive contamination by one of the following methods:
- Select a product with an enclosure type of at least IP54, NEMA/UL Type 12
- Provide an environmentally controlled location for the product that does not contain conductive contamination
Certifications

See the Product Certifications website, [rok.auto/certifications](rok.auto/certifications) for Declarations of Conformity, Certificates, and other certifications details.

<sup>(1)</sup> When product is marked, refer to [rok.auto/certifications](rok.auto/certifications) for Declarations of Conformity Certificates.

<sup>(2)</sup> Underwriters Laboratories Inc. has not evaluated the Safe Torque Off, or Safe Speed Monitor option modules for safety.
CE Conformity

CE Declarations of Conformity are available online at: the Product Certifications website, rok.auto/certifications.

The 20-750-S Safe Torque Off option module is in conformity with the essential requirements of the 2006/42/EC Machinery Directive and the 2004/108/EC EMC Directive when installed and maintained in accordance with the instructions that are contained in this document. The following standards have been applied to demonstrate conformity:

**Machinery Directive (2006/42/EC)**

- EN ISO 13849-1 Safety of machinery - safety-related parts of control systems - Part 1: General principles for design
- EN 60204-1 Safety of machinery - Electrical equipment of machines - Part 1: General requirements
- EN 62061 Safety of machinery - safety of safety-related electrical, electronic, and programmable electronic control systems
- EN 61800-5-2 Adjustable speed electrical power drive systems - Part 5-2: Safety requirement -
- IEC 61508 Part 1...7 safety of electrical/electronic/programmable electronic safety-related systems

**EMC Directive (2014/30/EU)**

- EN 61800-3 - Adjustable speed electric power drive systems - Part 3: EMC requirements and specific test methods
