A Resilient Converged Plantwide Ethernet Architecture

White Paper

August 2020

Rockwell Automation and Cisco Four Key Initiatives:

• **Common Technology View:**
  A single scalable architecture, using open EtherNet/IP™ standard networking technologies, is paramount to enable the Industrial Internet of Things for achieving the flexibility, visibility, and efficiency required in a competitive manufacturing environment.

• **Converged Plantwide Ethernet Architectures:**
  Collection of tested and validated architectures developed by subject matter authorities at Cisco, Panduit, and Rockwell Automation. The content of CPwE is relevant to both Operational Technology (OT) and Information Technology (IT) disciplines and consists of documented architectures, best practices, guidance, and configuration settings to help manufacturers with design and deployment of a scalable, reliable, safe, secure, and future-ready plant-wide industrial network infrastructure.

• **Joint Product Collaboration:**

• **People and Process Optimization:**
  Education and services to facilitate Operational Technology (OT) and Information Technology (IT) convergence, which can assist with successful architecture deployment, and helps to enable efficient operations that allow critical resources to focus on increasing innovation and productivity.

Document Reference Number: ENET-WP039E-EN-P
A Resilient Converged Plantwide Ethernet Architecture

The prevailing trend in Industrial Automation and Control System (IACS) networking is the convergence of technology, specifically IACS operational technology (OT) with information technology (IT). Converged Plantwide Ethernet (CPwE) helps to enable IACS network and security technology convergence, including OT-IT persona convergence, by using standard Ethernet, Internet Protocol (IP), network services, security services, and EtherNet/IP. A reliable and secure converged plant-wide or site-wide IACS architecture helps to enable the Industrial Internet of Things (IIoT).

Business practices, corporate standards, policies, industry standards, and tolerance to risk are key factors in determining the degree of resiliency and application availability required within an IACS plant-wide or site-wide architecture, for example, non-resilient LAN, resilient LAN, or redundant LANs. A resilient network architecture within an IACS application plays a pivotal role in helping to minimize the risk of IACS application shutdowns while helping to maximize overall plant/site uptime.

A holistic resilient plant-wide or site-wide network architecture is composed of multiple technologies (logical and physical) deployed at different levels within the plant/site. When selecting a resiliency technology, various plant/site application factors should be evaluated, including the physical layout of IACS devices (geographic dispersion), recovery time performance, uplink media type, tolerance to data latency and jitter, and future-ready requirements:

- Robust physical infrastructure
- Topologies and protocols
- Switching and routing
- Wireless LAN Controllers (WLC)
- Firewalls
- Network and device management

Deploying a Resilient Converged Plantwide Ethernet Architecture Design and Implementation Guide (DIG) outlines several use cases for designing and deploying resilient plant-wide or site-wide LAN architectures for IACS applications. CPwE Resiliency was architected, tested and validated by Cisco Systems, Panduit, and Rockwell Automation.
CPwE Overview

CPwE is the underlying architecture that provides standard network and security services for control and information disciplines, devices, and equipment found in modern IACS applications. The CPwE architectures (Figure 1) were architected, tested, and validated to provide design and implementation guidance, test results, and documented configuration settings. This can help to achieve the real-time communication, reliability, scalability, security, and resiliency requirements of modern IACS applications. The content and key tenets of CPwE are relevant to both OT and IT disciplines. CPwE key tenets include:

- Smart IIoT devices—Controllers, I/O, drives, instrumentation, actuators, analytics, and a single IIoT network technology (EtherNet/IP), facilitating both technology coexistence and IACS device interoperability, which helps to enable the choice of best-in-class IACS devices
- Zoning (segmentation)—Smaller connected LANs, functional areas, and security groups
- Managed infrastructure—Managed Allen-Bradley® Stratix industrial Ethernet switches (IES), Cisco Catalyst® distribution/core switches, FactoryTalk Network Manager software, and Stratix industrial firewalls
- Resiliency—Robust physical layer and resilient or redundant topologies with resiliency protocols
- Time-critical data—Data prioritization and time synchronization via CIP Sync™ and IEEE-1588 Precision Time Protocol (PTP)
- Wireless—Unified wireless LAN (WLAN) to enable mobility for personnel and equipment
- Holistic defense-in-depth security—Multiple layers of diverse technologies for threat detection and prevention, implemented by different persona (for example, OT and IT) and applied at different levels of the plant-wide or site-wide IACS architecture
- Convergence-ready—Seamless plant-wide or site-wide integration by trusted partner applications.
This release of the CPwE architecture focuses on EtherNet/IP which uses the ODVA, Inc. Common Industrial Protocol (CIP™) and is ready for the Industrial Internet of Things (IIoT). For more information on EtherNet/IP, CIP Sync, and DLR, see odva.org at the following URL:

**CPwE Resilient IACS Architectures Overview**

An IACS is deployed in a wide variety of industries such as automotive, pharmaceuticals, consumer packaged goods, pulp and paper, oil and gas, mining, and energy. IACS applications are composed of multiple control and information disciplines such as continuous process, batch, discrete, and hybrid combinations. One of the challenges facing industrial operations is the industrial hardening of standard Ethernet and IP-converged IACS networking technologies to take advantage of the business benefits associated with IIoT. A resilient LAN architecture can help to increase the overall equipment effectiveness (OEE) of the IACS by helping to reduce the impact of a failure and speed recovery from an outage, which lowers Mean-Time-to-Repair (MTTR).
Protecting availability for IACS assets requires a scalable defense-in-depth approach where different solutions are needed to address various network resiliency requirements for OEM, plant-wide or site-wide architectures. This section summarizes the Cisco, Panduit, and Rockwell Automation CPwE validated designs that address different aspects of availability for IIoT IACS applications.

- **Deploying Device Level Ring within a Converged Plantwide Ethernet Architecture Design and Implementation Guide** outlines several use cases for designing and deploying DLR technology with IACS device-level, switch-level, and mixed device/switch-level single and multiple ring topologies across OEM and plant-wide or site-wide resilient LAN IACS applications.

- **Deploying Parallel Redundancy Protocol within a Converged Plantwide Ethernet Architecture Design and Implementation Guide** outlines several use cases for designing and deploying Parallel Redundancy Protocol (PRP) technology with redundant LANs across plant-wide or site-wide IACS applications.

- **Deploying a Fiber Optic Physical Infrastructure within a Converged Plantwide Ethernet Architecture Application Guide** helps designers and installers select and deploy fiber optic media in plant/site environments. It details fiber optic network infrastructure solutions that provide high-performance connectivity options that help increase the integrity and availability of a CPwE architecture at each level of the OEM, plant-wide or site-wide network.

- **Physical Infrastructure for the Converged Plantwide Ethernet Architecture Application Guide** which helps customers address the physical deployment associated with converged plant-wide or site-wide EtherNet/IP architectures. As a result, users can achieve resilient, scalable EtherNet/IP networks that can support proven and flexible CPwE logical architectures designed to help optimize OEM, plant-wide or site-wide IACS network performance.

- **Deploying A Resilient Converged Plantwide Ethernet Architecture Design and Implementation Guide** outlines several use cases for designing and deploying resilient plant-wide or site-wide architectures for IACS applications, utilizing a robust physical layer and resilient LAN topologies with resiliency protocols.

CPwE Resiliency Solution Use Cases

The CPwE Resiliency architecture supports scalability which includes the degree of resiliency applied to a plant-wide or site-wide architecture. Scalable resiliency comes in many forms; that is, technology choices in topology and distribution switch. For the Deploying a Resilient Converged Plantwide Ethernet Architecture DIG, the following represents a portion of the use cases that were architected, tested, validated and documented by Cisco Systems, Panduit, and Rockwell Automation.

Allen-Bradley Stratix and Cisco Industrial Ethernet Switches (IES)

Refer to Figure 2.

- Form factor:
  - DIN rail / panel mount
  - 19” rack mount - 1 RU (rack unit)
- Hot Standby Routing Protocol (HSRP) first hop redundancy protocol
- Redundant star switch-level topology:
  - Flex Links resiliency protocol
  - MSTP resiliency protocol
- Ring switch-level topology:
  - Resilient Ethernet Protocol (REP)
  - Device Level Ring Protocol (see CPwE DLR)
  - Multiple Spanning Tree Protocol (MSTP) resiliency protocol
  - Single and dual media ring:
    - EtherChannel for dual media ring only
Catalyst 9500 Aggregation/Distribution Switches

Refer to Figure 3.

- Cisco Catalyst 9000 platform StackWise Virtual technology allows the clustering of two physical switches together into a single logical entity. The two switches operate as one; they share the same configuration and forwarding state. This technology allows for enhancements in all areas of network design, including high availability, scalability, management, and maintenance. StackWise Virtual also incorporates many other Cisco innovations, such as Stateful Switch Over (SSO), Non-Stop Forwarding (NSF), and Multi-chassis EtherChannel (MEC).

- Hot Standby Routing Protocol (HSRP) first hop redundancy protocol

- Redundant star switch-level topology:
  - Multi-chassis EtherChannel (MEC) port aggregation
  - Flex Links resiliency protocol
  - MSTP resiliency protocol

- Ring switch-level topology:
  - REP
  - MSTP resiliency protocol
  - Single and dual media ring

Catalyst 4500-X Aggregation/Distribution Switches

Refer to Figure 3.
- Virtual Switching System (VSS) virtualization technology that combines two physical switch chassis into one virtual switch, with Stateful Switch Over (SSO) and Non-stop forwarding (NSF)
- Hot Standby Routing Protocol (HSRP) first hop redundancy protocol
- Redundant star switch-level topology:
  - Multi-chassis EtherChannel (MEC) port aggregation
  - Flex Links resiliency protocol
  - MSTP resiliency protocol
- Ring switch-level topology:
  - REP
  - MSTP resiliency protocol
  - Single and dual media ring

Note: Cisco, Panduit, and Rockwell Automation recommend migrating from Catalyst 4500-X to Catalyst 9500 series as the aggregation/distribution switch platform.
Catalyst 9300 StackWise-480 Aggregation/Distribution Switch

Refer to Figure 4.

- Switch stack, which is a set of up to eight stacking-capable switches, connected through their StackWise-480 ports, and united to form a logical unit
- Redundant star switch-level topology:
  - EtherChannel port aggregation
  - Flex Links resiliency protocol
  - MSTP resiliency protocol
- Ring switch-level topology:
  - REP
  - MSTP resiliency protocol
- Single and dual media ring

Catalyst 3850 StackWise-480 Aggregation/Distribution Switch

Refer to Figure 4.

- Switch stack, which is a set of up to nine stacking-capable switches, connected through their StackWise-480 ports, and united to form a logical unit
- Redundant star switch-level topology:
  - EtherChannel port aggregation
  - Flex Links resiliency protocol
  - MSTP resiliency protocol
- Ring switch-level topology:
  - REP
  - MSTP resiliency protocol
  - Single and dual media ring

Note Cisco, Panduit, and Rockwell Automation recommend migrating from Catalyst 3850 to Catalyst 9300 series as the aggregation/distribution switch platform.
Figure 4  Catalyst 9300 or Catalyst 3850 Aggregation/Distribution Switch

Cell/Area Zone – Levels 0-2
Redundant Star Topology
(Lines, Machines, Skids, Equipment)

Cell/Area Zone 1 – Levels 0-2
Ring Topology
(Lines, Machines, Skids, Equipment)

Cell/Area Zone N – Levels 0-2
Ring Topology
(Lines, Machines, Skids, Equipment)
Core Switches

Large scale architectures typically use modular chassis-based core switches, such as Cisco Catalyst 9600 and 6800 platforms. In addition to having redundant hardware components, core switches are configured as resilient pairs utilizing StackWise Virtual or VSS technology.

Refer to Figure 5.

Figure 5  Core Switches—Traditional versus VSS Design

Medium and small-scale architectures can use fixed-size switch platforms as a core, such as Cisco Catalyst 9500 with StackWise Virtual technology, or use a collapsed core/distribution model.

Robust Physical Infrastructure

Successful deployment of CPwE logical architectures depends on a robust physical infrastructure network design that addresses environmental and performance challenges with best practices from Operational Technology (OT) and Information Technology (IT). For the Deploying a Resilient Converged Plantwide Ethernet Architecture DIG, Cisco, Panduit and Rockwell Automation have collaborated to reference Panduit’s building block approach for physical infrastructure deployment. This approach is reflected in Physical Infrastructure for the Converged Plantwide Ethernet Architecture Application Guide, which helps customers address the physical deployment associated with converged plant-wide or site-wide EtherNet/IP. As a result, users can achieve resilient, scalable networks that can support proven and flexible CPwE logical architectures designed to help optimize plant-wide or site-wide IACS network performance.

Refer to Figure 6.

For Physical Infrastructure for the Converged Plantwide Ethernet Architecture Application Guide, the following use cases were documented by Panduit:

- Robust physical infrastructure design considerations and best practices
- Control Panel:
  - Electromagnetic interference (EMI) noise mitigation through bonding, shielding and grounding
  - Industrial Ethernet Switch (IES) deployment within the Cell/Area Zone
- Physical Network Zone System:
  - IES and Access Point (AP) deployment within the Cell/Area Zone
- Cable distribution across the Industrial Zone
Release Notes

This section summarizes the extensions to CPwE Resiliency in this August 2020 release:

- Test Hardware, Software, test results and reference architecture for Catalyst 9300 as distribution/aggregation switch
- Test Hardware, Software, test results and reference architecture for Catalyst 9500 as distribution/aggregation switch
- Test Hardware, Software, test results and reference architecture for Catalyst 9500 as core switch
- References to Deploying Parallel Redundancy Protocol within a Converged Plantwide Ethernet Architecture

This section summarizes the extensions that were added to the CPwE Resiliency February 2018 release:

- Industrial Distribution Frame (IDF):
  - Industrial aggregation/distribution switch deployment within the Industrial Zone
- Industrial Data Center (IDC):
  - Physical design and deployment of the Level 3 Site Operations

Figure 6 Panduit Robust Physical Infrastructure for the CPwE Architecture
Summary

CPwE is a collection of architected, tested, and validated designs. The testing and validation follow the Cisco Validated Design (CVD) and Cisco Reference Design (CRD) methodologies.

The content of CPwE, which is relevant to both operational technology (OT) and informational technology (IT) disciplines, consists of documented architectures, best practices, guidance, and configuration settings to help industrial operations and OEMs with the design and deployment of a scalable, reliable, secure, and future-ready plant-wide or site-wide industrial network infrastructure. CPwE can also help industrial operations and OEMs achieve cost reduction benefits using proven designs that can facilitate quicker deployment while helping to minimize risk in deploying new technology. CPwE is brought to market through an ecosystem consisting of Cisco, Panduit, and Rockwell Automation emergent from the strategic alliance between Cisco Systems and Rockwell Automation.

Resilient plant-wide or site-wide network architectures play a pivotal role in helping to confirm overall plant/site uptime for industrial operations. IACS application requirements such as availability and performance drive the choice of resiliency technology. A holistic and scalable resilient plant-wide or site-wide network architecture is composed of multiple technologies (logical and physical) deployed at different levels within plant-wide or site-wide architectures. When selecting resiliency technology, various IACS application factors should be evaluated, including physical layout of IACS devices (geographic dispersion), recovery time performance, uplink media type, tolerance to data latency and jitter and future-ready requirements.

The Deploying a Resilient Converged Plantwide Ethernet Architecture Design and Implementation Guide (DIG) outlines several use cases for designing and deploying a scalable and holistic resilient plant-wide or site-wide Industrial Automation and Control System (IACS) network infrastructure. CPwE Resiliency highlights the key IACS application requirements, technology and supporting design considerations to help with the successful design and deployment of these specific use cases within the CPwE framework. CPwE Resiliency was architected, tested and validated by Cisco Systems, Panduit, and Rockwell Automation.
